

Market Monitoring: Shelter and Household Items

22-29 June 2026 | Gaza Strip

Context & Rationale

As of June 2026, the humanitarian situation across the Gaza Strip remains critical following renewed hostilities, repeated displacement, and continued restrictions on the movement of goods and people. Widespread destruction of housing, infrastructure, and essential service networks continues to severely affect living conditions, with many households residing in damaged buildings, makeshift shelters, or overcrowded displacement sites. Shelter-related needs remain acute across all governorates, while limited recovery efforts and ongoing insecurity continue to constrain access to adequate housing and basic services¹.

Markets remain under severe pressure. Restrictions on commercial inflows, disruptions to supply chains, and ongoing insecurity have significantly reduced the availability of shelter materials, tools, and essential household items. Vendors report persistent shortages of key commodities, irregular market operations, and substantial price volatility, limiting households' ability to meet basic shelter and household needs through local markets². These constraints are further compounded by widespread displacement, reduced purchasing power, and continued reliance on humanitarian assistance.

In this context, timely and evidence-based market monitoring remains essential to inform humanitarian shelter programming. Conducted under the Shelter Cluster's Technical Working Group on Cash and Markets for Shelter, this assessment provides a snapshot of market functionality, commodity availability, and price trends for key shelter, repair, and household items based on vendor perspectives. The findings aim to identify market constraints and inform evidence-based, market-sensitive shelter responses across the Gaza Strip.

Key Findings

- **Nearly all assessed items were reported as having either no availability or low availability across all governorates in the Gaza Strip.** The only exceptions were regular adhesive duct tape (non-construction quality) and re-used metal rebar, which were reported as widely available in Khan Yunis only.

- **Construction materials were largely reported as unavailable, reflecting the continued constraints on recovery and rehabilitation activities.** Key construction materials, including cement, metal rebars, and corrugated galvanized iron (CGI) sheets, were widely reported as having limited or no availability across assessed markets.

- **The overall availability of shelter items declined compared with the February 2026 assessment³.** Since the previous round, the availability of several key shelter items has deteriorated, reflecting continued instability in shelter-related markets. This decline is driven by ongoing restrictions on the import of essential materials, resulting in a growing number of shelter items being reported as completely unavailable.

- **Market activity in June remained low across the Gaza Strip.** Most vendors reported low to very low levels of activity, with a higher proportion indicating reduced market activity compared with the February 2026 round. Limited market functionality was attributed to supply shortages, high transportation costs, customs fees, reliance on a single crossing for commercial and humanitarian inflows, and elevated supplier prices.

- **Commercial suppliers remained the primary source of shelter, household, and tools/site-level items,** underscoring the continued role of formal market actors in supplying goods across the Gaza Strip. Individuals selling their own goods were reported as the second most common source of commodities, highlighting the role of secondary markets in complementing limited commercial supply. This pattern may reflect increased circulation of used goods and could indicate broader economic pressures affecting households, including potential reliance on asset sales as a coping strategy.

Map 1: Assessed Markets and Interviews per Municipality

* Limited coverage in Northern Gaza governorate.

Median Prices (ILS), by Governorate

Items	Unit	Gaza	Deir Al-Balah	Khan Younis
Energy				
Fuel (kerosene)	1 L	35	35	35

● Available ● Low Availability ● Not Available ● No Consensus

The colors in this table indicate the majority response from vendors. If an item is reported as unavailable by the majority of vendors, it is marked in red. Similarly, blue indicates availability, and yellow indicates limited availability.

Item Availability and Prices

- **Reported item availability is based on vendors' perceptions during the data collection period.** Vendors assessed the availability of item categories corresponding to the goods they sell (e.g., a fuel vendor reported on all energy-related items). Findings therefore reflect market conditions during the week of data collection only, as availability can change rapidly. Partners may use these findings as a reference when designing cash and voucher assistance approaches, while complementing them with their own verification and context-specific assessments in the targeted governorates.

- During the June data collection round, **most energy items, shelter items, household items, and tools and site-level items were reported as having limited or no availability across the Gaza Strip.** Ongoing economic pressures continued to strain market supply, while humanitarian needs for emergency shelter and household items remained extremely high, with many essential items requiring regular replenishment⁴.

- **Fuel and cooking gas were also consistently reported as having low availability.** In response to shortages of gas cylinders, vendors reported adapting sales practices by selling cooking gas based on the quantity purchased (by kilogram), rather than through full cylinder exchanges. Reported prices ranged from 90–120 ILS per kg, substantially exceeding the official price of 74 ILS per kg set by the relevant authority at the time of data collection. **Kerosene (locally known as kaz) has not entered the Gaza Strip since October 2023.** As a result, fuel prices reported in this assessment refer to solar (the local term for diesel fuel), which is currently used for generators, water pumps, and, in some cases, vehicles. Imported solar was reported at a fixed price of 35 ILS per litre, while locally produced ranged between 15–25 ILS per litre.

- **Most building materials, including cement and new concrete blocks were widely reported as completely unavailable across the Gaza Strip. Cement was reported as having limited availability only in Gaza Governorate.** Old (salvaged) concrete blocks were also reported as having limited availability, with median prices ranging between 5–7.5 ILS per block. Cement available in the market at lower prices was described as being of poor quality and sold in 1 kg quantities. In addition, wholesalers in Gaza reported the availability of newly supplied locally treated cement, sold in 25 kg bags at approximately 750 ILS.

- **The availability of regular and heavy adhesive duct tape declined compared to February and was reported as limited across markets.** Newly monitored items, including **summer blankets and mattresses, were also reported as having limited availability,** with a median price of 35 ILS for summer blankets and 180 ILS for mats. Most reported mats measured approximately 3×4 m.

- **Solar lights, including both household and site-level types, were reported as completely unavailable across the Gaza Strip, except in Khan Younis where limited availability was reported.** Household solar lights recorded a median price of 345 ILS. Site-level solar lights showed a wider price range, with prices ranging between 650–1,500 ILS.

- For **construction materials**, new CGI sheets were reported as having no to very low availability across the Gaza Strip, with a median price of 225 ILS per m². Old CGI sheets were reported at a median price of 50 ILS per m². **Timber also remained low in availability across the Gaza Strip**, consistent with the previous round, and is typically sold in standard dimensions such as 5×2.5 cm and 10×2.5 cm, with prices varying according to size. The median price for timber measuring 5×2.5 cm was 25 ILS per piece, while timber measuring 10×2.5 cm had a median price of 30 ILS per piece. **Items introduced newly in this market monitoring round, including new metal rebars, were reported as having very low to no availability.** Median prices ranged between 65–75 ILS per bar, depending on length, with 12 m and 14 m being the most commonly available sizes. In comparison, prices for used metal rebars were more variable, reflecting their relatively higher, though still limited, availability across assessed markets. Plywood/timber sheeting also exhibited considerable price variability due to differences in availability, type, and thickness. Timber pallets recorded a median price of 120 ILS per unit; however, vendors also commonly sold timber pallets by weight, with individual pallets typically weighing 12–15 kg. The reported price for timber pallets sold by weight ranged between 10–13 ILS per kg, depending on quality.

- **Tools were largely reported as having limited availability across the Gaza Strip. Site-level items, including fire extinguishers, buckets, and solar lights, also faced significant availability constraints.** Fire extinguishers were reported as completely unavailable, despite increased needs due to a rise in fire incidents in shelters and displacement sites⁵. Their unavailability was attributed to import restrictions, as they are classified as dual-use items. As an alternative, vendors reported that limited refilling services for gas-type fire extinguishers were available through a small number of suppliers, with prices ranging between 200–400 ILS, depending on extinguisher size and service type. **Similarly, items such as buckets, which were reported as widely available in the previous round, were reported as having limited availability in the current round.** The median price increased to 30 ILS, compared with 20 ILS in the previous round.

Map 2: Tools and Site-Level item Vendors Sourcing Goods of Commercial Origin

Sample sizes vary by municipality; see Annex 2 for a detailed breakdown. Vendor categories specifications are provided in Annex 3.

This table presents median item prices by municipality, expressed in Shekels (ILS). * No data (commodity not reported as available by vendors or reported as completely unavailable by most vendors).

Physical Barriers to Access Markets

In the 7 days preceding data collection, **41% of surveyed shelter and household item vendors reported factors that negatively affected the ability of vendors or customers to travel to, work in, or access marketplaces.**

Reported challenges varied across governorates, with the highest proportion of vendors reporting access constraints in Gaza (70%), followed by Deir al Balah (59%) and Khan Younis (46%). **Although access constraints remained widespread, this represents an improvement compared with the December round, when 80% of vendors, reported similar challenges.**

The most commonly reported constraint was limited or unavailable transportation options (40%), which affected both customer access to markets and the movement of goods.

Safety-related concerns were also reported by vendors, with 27% indicating that they felt unsafe accessing or travelling to the marketplace.

Additional barriers included customers feeling unsafe around certain individuals in the marketplace (14%) and ongoing active fighting in the area (10%), both of which continued to undermine safe access to markets. Furthermore, 10% of vendors reported hazards or damage on roads leading to the marketplace, posing risks to both traders and customers.

Access to a Locked, Secured Storage Facility

Over the 7 days prior to data collection, **the majority of vendors (80%) reported having access to a locked, secure storage space** within their own business facilities in the Gaza Strip. Access to secure storage is important for protecting goods from theft, weather related damage and pests, and allows vendors to maintain a stock of goods to ensure continuity of items available on the market.

Proportion of vendors reporting on access to a locked, secured storage facility, per governorate

	Gaza	Deir Al Balah	Khan Younis
Yes, within my own business facilities	59%	45%	61%
Yes, elsewhere within the marketplace	17%	13%	5%
Yes, I store goods at another facility outside this marketplace	10%	16%	4%
No, I do not have access to a secure storage space	12%	18%	29%

Operational Challenges for Vendors of Shelter and Household Items

In the 7 days prior to data collection, vendors reported several operational challenges affecting stock availability and market operations. **The most commonly reported challenges were the limited availability of essential goods (48%) and price fluctuations (42%).** Additionally, **41% of vendors reported increased transportation and fuel costs**, while 27% indicated that high supplier prices constrained their ability to purchase and replenish stock.

Most reported operational challenges by vendors in the 7 days prior to data collection, per governorate

	Gaza	Deir Al Balah	Khan Younis
Difficulties with availability of core goods	36%	58%	47%
Price fluctuation	52%	36%	42%
Increased price/high cost of transportation (or fuel for transportation)	42%	33%	45%
Price increases/high prices from suppliers impacts ability to buy stocks	24%	33%	24%
Wholesalers using their bargaining power to set unfair prices	27%	27%	14%

Market Activity

Market activity across the Gaza Strip remained constrained and uneven during June. While some informal and small-scale trading continued, particularly for basic food items and essential household commodities, overall market functionality was limited by inconsistent supply, disrupted trade routes, and continued reliance on a single crossing for both humanitarian and commercial cargo during the assessed period and preceding weeks. This dependence contributed to ongoing uncertainty in market supply and operations.

According to the Gaza Chamber of Commerce, **568 truckloads of shelter materials** entered the Gaza Strip between 1 and 28 June, equivalent to approximately 20 truckloads per day. Daily inflows fluctuated considerably, ranging from 9 to 57 truckloads per day for shelter items, with the majority carrying humanitarian cargo⁶.

Although commercial inflows increased in June compared with May, supply chains remained fragile. The continued reliance on a single crossing, combined with fluctuating daily inflows, constrained market recovery and the ability of vendors to maintain consistent stock levels. Consequently, the availability of several commodities, particularly shelter materials and durable household items, remained limited, leaving markets highly sensitive to access constraints and supply disruptions and reducing households' ability to meet essential needs through local markets.

Vendor Perceptions of Market Activity⁷

Shelter and Household Item Needs

Findings from the Comprehensive Shelter Needs Assessment⁸ indicate that shelter conditions across the Gaza Strip remain critical, with inadequate shelter conditions contributing to widespread health risks. **90% of households reported rodents in their shelter, while more than one-third reported rodent bites or contamination of drinking water by rodents, and 33% reported contaminated food stocks.**

Shelter and household item needs remain widespread, with **only 3% of households reporting no need for shelter items.** The most commonly reported needs included tarpaulins (72%) and shelter repair items (34%), while household item needs included shampoo (89%), soap (85%), and jerrycans (82%). These findings highlight continued gaps in access to essential shelter and household items.

Shelter, Household Items and Tools Suppliers

Reliance on a single supplier for shelter items was reported by a minority of interviewed vendors across assessed governorates, with similar proportions observed in Gaza Governorate (22%) and Deir al Balah (20%), compared with a lower share in Khan Younis (10%). A similar pattern was observed among tools and site-level item vendors, with 32% of vendors in Gaza Governorate reporting reliance on a single supplier.

Reliance on a single supplier may increase vendors’ exposure to supply disruptions and price fluctuations, potentially limiting their flexibility in responding to market changes and affecting the consistency of item availability and prices.

>82% of vendors reported to rely on more than one supplier for shelter items, across assessed municipalities

Type of Supplier

Across Deir al-Balah, Khan Younis, and Gaza governorates, vendors predominantly reported relying on wholesalers as their main source for shelter items, tools and site-level items. Other sources included larger vendors within Gaza supplying a broad client base, followed by smaller vendors or individual suppliers with more limited outreach. This reliance on wholesalers is consistent with the current structure of Gaza’s commercial supply chain. Continued restrictions on commercial imports, fluctuating truck entries, and dependence on a limited number of entry points have concentrated the distribution of goods among a relatively small number of wholesalers with access to incoming commercial cargo. Consequently, vendors often rely on these wholesalers to replenish stock, limiting opportunities to diversify suppliers. Where commercial supply is constrained, vendors also reported sourcing selected commodities through secondary markets, including humanitarian assistance entering local markets and, for some construction materials, recovered or salvaged materials⁹.

Shelter Item Origin

Moreover, 87% of vendors selling tools and site-level items reported sourcing their items from commercial suppliers, followed by 38% from individuals selling their own goods and 24% from humanitarian assistance.

E-wallet Acceptance

Percentage of vendors that accept any of the following types of payment from their customers

Reasons Limiting Vendors’ Acceptance of Mobile Money/E-wallets

Although shelter and household item vendors reported relatively high acceptance of e-wallet and mobile money payments during the data collection period, several operational and structural barriers continue to limit their use. The most commonly reported constraint was limitations related to transaction ceilings and the number of permitted transactions (40%)*, reflecting restrictions within digital payment systems and liquidity management constraints. This was followed by technical issues in the application used (29%), including system errors and transaction failures. Network coverage and internet connectivity issues (19%) also continued to affect transaction reliability, particularly in areas with unstable telecommunications infrastructure. A smaller proportion of vendors (6%) reported lack of trust in e-wallet and mobile money systems, highlighting persistent confidence-related barriers.

These findings align with broader evidence on the functionality of digital financial services in Gaza, where constrained financial infrastructure, liquidity shortages, and intermittent connectivity continue to limit the scalability of cashless payment systems. Humanitarian and market monitoring reports have noted that while e-wallets and mobile money platforms have expanded as coping mechanisms during periods of cash shortages, their effectiveness remains constrained by system-level limitations, inconsistent network performance, and regulatory or operational transaction cap¹⁰. In this context, digital payment systems function primarily as a complementary and constraint-driven payment modality rather than a full substitute for cash, particularly in volatile market environments where vendors rely on flexible payment options to manage stock replenishment and supplier payments.

* In the Gaza context, transaction ceilings and limits on the number of permitted transactions may affect households’ ability to access and use cash assistance flexibly. These restrictions can be particularly challenging where households face urgent and frequent expenses, limited cash availability, and additional costs or barriers associated with cashing out or transferring funds.

Methodology

The Gaza Shelter and Household Items Market Monitoring Assessment is a quantitative key informant (KI) exercise targeting purposively sampled vendors within their respective market areas. The assessment was conducted under the Shelter Cluster's Technical Working Group on Cash and Markets for Shelter and focused on market access, item availability, and pricing. The scope of the tool was expanded to include shelter materials, tools, site-level items, and core household items, in coordination with Shelter Cluster partners and the Site Management Cluster. The expanded item list incorporated transitional shelter materials, including CGI sheets, plywood, and concrete blocks, as well as additional tools and site-level items relevant to current shelter and displacement site needs.

Data collection was conducted independently, with partners contributing to the refinement of the item list but not participating directly in the data collection process.

Markets are selected based on field capacity and access, as well as field teams' assessments of their relative importance within each governorate. The most significant marketplaces were identified based on findings from the previously conducted round of the exercise¹¹ and previously conducted market mapping in October 2025¹².

A standardized data collection tool was used to collect data on the price and availability of selected shelter, tools and household items, alongside key challenges reported from vendors' perspectives. Prices are reported per specified unit, such as per kilogram or liter for items typically sold by weight, unless an item is commonly sold as an individual unit (e.g. tent) or by area or length, such as plastic sheeting measured in square meters.

Data collection

In each assessed market location, the target was to collect at least three prices per

shelter and household item, where feasible, from different vendors to support data quality and consistency. However, due to limited item availability in Gaza, this criterion was not met for all items in some municipalities. Data collection was conducted between 22–29 June 2026 including remote and in person data collection. Remote data collection leveraged a Key Informant network comprising of 311 vendors and a total 750 surveys in 15 municipalities across four governorates: Khan Younis, Deir al Balah, Gaza Governorate, with limited coverage in Northern Gaza.

Identification of Vendors

Vendors are retailers or individuals selling directly to consumers. Moreover, vendors sell at least one category of goods included in this assessment and the person interviewed was the owner of the shop, or someone who had sufficient knowledge about the business operations.

Enumerators and training

Data were collected both in-person and remotely by trained field staff with strong familiarity with local market conditions and dynamics. Enumerators received comprehensive training from a facilitator experienced in the assessment methodology, data collection tools, and quality assurance procedures. Data collection was conducted using the Kobo mobile application.

To support data quality and monitoring throughout the exercise, field teams were also provided with a daily tracking to monitor the progress of price data collection and ensure adequate coverage of assessed markets and items.

Data cleaning and analysis

Following data collection, data was compiled and cleaned, normalizing prices, cross-checking outliers, and calculating the medians and percentages of collected market indicators in each assessed location.

The median item prices reported in this factsheet are 'location medians', designed to minimise the effects of outliers and differing amounts of data among assessed locations. The median prices of all assessed items are calculated within each assessed municipality.

Challenges and Limitations

- The situation in the Gaza Strip is highly sensitive and changing rapidly so the information presented in this brief only provides a snapshot of the situation during the reporting period and might become outdated quickly. As such, price data is only indicative for the time frame within which it was collected. It is important to note that ongoing and significant disruptions to supply chains, including restrictions on imports and movement, play a critical role in shaping market trends and the availability of goods, adding further volatility to the data.
- Given current access constraints, data collection was primarily conducted in markets located in areas that remain accessible. Consequently, no data were collected from Rafah Governorate, while coverage in North Gaza Governorate remained limited.
- Due to shortages of shelter items, prices for some items were not collected in certain municipalities, as these items were unavailable in the assessed markets.
- Predefined measurement units did not always align with how items were available or commonly sold in markets, which may affect comparability of price and availability data across locations.

Annex 1: Vendor Sample Size by Municipality

Municipality	Number of Vendors (n)
Gaza	201
Khan Yunis	177
Deir al Balah	106
Khan Yunis Camp	55
An Nuseirat	37
Al Qarara	24
Jabalya	19
An Nuseirat Camp	30
Deir al Balah Camp	10
Ash Shati' Camp	30
Az Zawayda	34
Al Bureij	3
Al Maghazi	18
Beit Lahiya	5
Jabalya Camp	1
Total	n=750

Annex 2: Tools and Site-Level item Vendors Sourcing Goods of Commercial Origin

Municipality	Number of Vendors (n)
Gaza	49
Khan Yunis	33
Deir al Balah	20
Khan Yunis Camp	10
An Nuseirat	5
Al Qarara	8
Jabalya	6
An Nuseirat Camp	4
Deir al Balah Camp	2
Ash Shati' Camp	4
Az Zawayda	2
Al Bureij	1
Al Maghazi	3
Jabalya Camp	1
Total	n=148

Annex 3: Vendor Categories and Item Specifications

Items		Specifications
Energy Category		
Fuel (kerosene)	1 L	No specifications.
Firewood	1 kg	No specifications.
Gas cylinder	8 kg	No specifications.
Shelter Items Category		
Plastic sheeting	1 m²	At least 0.15 mm thick.
High quality tarpaulin (4x6)	24	Humanitarian standard tarpaulin: size 4m x 6m, GSM: at least 190 gm/sq.m.
Lower quality tarpaulin	1 m²	Non-humanitarian standard tarps: at least polyethylene and 0.15mm thickness (can come in many colors).
Heavy adhesive duct tape	1 un	For construction At least 0.2mm thick, 48mm width.
Regular adhesive duct tape	1 un	Not for construction.
Nylon Rope (3-8 mm)	1 m	3 to 8 mm (nylon ropes).
Geodesic tents	1 un	Humanitarian standard tent: Geodesic tent and Family tent.
Lower quality tents	1 un	Non-humanitarian tents (includes all tents except geodesic and family tent).
Cement	1 kg	Portland cement or locally available cement in Gaza.
Nails 20-30 mm	1 kg	20 to 30 mm nail (used for cladding of tarpaulin).
Nails 40-60 mm	1 kg	40 to 60 mm (for use on timber and concrete).
Sandbags	1 un	Flour sacks (as sandbags are not approved).
Timber	1 m	Timber section varying in sizes and lengths. Example: 5cmx5cm or 5cmx2.5cm section size.
Plywood/timber sheeting	1 m²	At least 4mm thickness, OSB, MDF and plywood. MDF may also be coated with different colors.
Timber pallets	1 un	No specification. Could be any timber pallets available in the market.
Metal section	1 m	L, C, square, section.
Old/used metal re-bar	1 m	No specifications.
New metal rebar	1 m	No specifications.
New concrete blocks	1 un	New – could be of varying sizes.
Old concrete blocks	1 un	Old (reused) - could be of varying sizes.
New CGI sheets	1 m²	New – usually available in standard sizes.
Old CGI sheets	1 m²	Old (reused) - usually available in standard sizes.
Household Items Category		
Summer blanket	1 un	Summer blanket weight not more than 400 GSM.
Mattress (single)	1 un	At least 5 cm thick, cover should be waterproof; gsm 1000 gm/sq.m.
Mat	1 un	Density: not less than 250 gm/m².
Household level solar light	1 un	Provides lighting for no less than 5 hours, 3-5 Watts (note: do not consider hand-held torches)
Site level solar light	1 un	Water grade/outdoor flood light (~50W for site level coverage) with solar panel, battery and 6-8m mounting pole, light time of 10+ hours.
Tools and Site-level Items Category		
Claw hammer	1 un	Claw hammer with curved claw for nail removal, wood, fiberglass, or rubberized handle.
Handsaw	1 un	Handsaw for cutting wood.
Shovel	1 un	Metal head with handle.
Pickaxe	1 un	Metal head, one end is sharp and the other head is flattened.
Wheelbarrow	1 un	For transporting construction materials - could be of different sizes.
Bucket	1 un	Generally, of 16-20 liters capacity.
Fire Extinguisher	1 un	12 KG powder fire extinguisher.

Annex 4: Shelter Cluster Operational Recommendations for Partners for Shelter Interventions through CVA modality

Based on the June 2026 shelter and household items' market monitoring exercise findings, Shelter Cluster partners are encouraged to consider the following recommendations:

1. Prioritize market assessments before selecting assistance modalities. Partners must verify local market conditions immediately prior to implementation. Communities needs and capacities, agency capacity, along with humanitarian and market access can best inform shelter modality.

2. Align programme design with market findings and Shelter Cluster technical guidance. Partners are encouraged to align the scope of work and assistance packages or BOQs, based on market availability, prices, and in line with wider Shelter Cluster's technical guidance and cash thresholds such as carrying out emergency repairs or improving makeshift shelters. Partners should monitor commodity availability, prices, and vendor capacity throughout project implementation and adapt programmes accordingly.

3. Strengthen market access for affected communities. Where cash and voucher assistance is implemented, partners should ensure that targeted households have access to functional markets and qualified vendors, especially for vulnerable groups.

4. Integrate livelihoods and Cash-for-Work opportunities where feasible. Partners are encouraged to incorporate cash-for-work or livelihood components alongside shelter interventions where context permits to better support local recovery and enhance community resilience.

5. Promote localized approaches. Where feasible, partners should explore localized programming that maximizes the use of locally available skills and resources, including the safe recovery, reuse, and recycling of suitable construction materials. This approach cannot be scaled up due to limited material supply and market distortion risks need to be monitored.
