

# FOOD SECURITY MONITOR

AFRICA  
FOOD TRADE  
AND RESILIENCE  
INITIATIVE

The monthly Food Security Monitor is a critical tool for stakeholders across the African agricultural landscape. This report equips policymakers, practitioners, and the wider community with vital insights to navigate challenges, prioritise interventions, and ultimately build a more food-secure future for all. This 70<sup>th</sup> edition provides an overview of the food security situation and market prices across East, Southern, and West Africa.

The Food Security Monitor is produced with support from the UK Government's Foreign, Commonwealth & Development Office (FCDO) through the Africa Food Trade & Resilience Programme.

The opinions expressed in this report are those of the authors and do not reflect the official policy or position of AGRA, its employees, partners, or affiliates in any way. While AGRA has made every effort to ensure the accuracy and completeness of the information entered in this report, we assume no responsibility for any errors, inaccuracies, omissions, or inconsistencies included herein. The mention of specific companies, manufacturers, or their products, whether patented, does not imply endorsement, recommendation, or approval by AGRA, its employees, partners, or their affiliates in preference to others of a similar nature that are not mentioned. The descriptions, charts, and maps used do not imply the expression of any opinion whatsoever by AGRA concerning any country's development, legal, or constitutional matters.

## Summary

AGRA's monthly Food Security Monitor serves as a vital tool for sharing timely data with key stakeholders, supporting informed, evidence-based decisions across the agricultural sector. Below are key highlights from the June 2026 Food Security Monitor edition:

### Global Market Updates

- **In June 2026, global food commodity prices showed mixed trends, with the FAO Food Price Index averaging 130.3 points, down 0.3% from May but 1.7% higher than a year earlier**, as declines in cereals, dairy, and sugar prices, driven by strong supplies and improved production prospects, offset gains in vegetable oils and meat. Vegetable oil prices increased due to tighter palm oil supplies and strong biofuel demand, while meat prices reached a record high, supported by higher poultry and bovine meat prices. **Similarly, the International Grain Council's Grains and Oilseeds Index fell 1.4% month-on-month to 224.2 but remained 5.8% above its year-earlier level, reflecting short-term market weakness amid generally stronger annual prices.** Rice prices rose the most, both monthly and annually, while barley recorded the largest monthly decline. Wheat and maize prices also eased during the month but stayed above year-ago levels, and soybeans posted the strongest annual increase among oilseeds despite a slight monthly dip.
- **Global fertilizer markets are showing signs of easing after a period of sharp increases, supported by the reopening of the Strait of Hormuz for just short period:** lower freight costs and increased urea exports from Iran and China, have driven urea prices down despite remaining above year-ago levels. Since the agreement, around 640,000 metric tons of sulphur and 427,000 metric tons of urea have moved through the waterway, a significant increase compared with volumes shipped during the conflict. The resumption of trade has eased concerns over a potential global food price crisis that could have resulted from fertilizer shortages and reduced crop yields. However, analysts caution that recovery remains slow, with fertilizer markets expected to remain tight in the near term despite the gradual improvement in maritime flows. Consequently, significant uncertainty persists due to geopolitical risks evidenced by the collapse of the ceasefire after few days, policy shifts, production costs, and climate-related disruptions. At the end of June, phosphate fertilizer prices remained high, with DAP declining slightly to US\$910/MT and MAP edging up to US\$954/MT, both posting strong year-on-year gains of over 12%, while potash remained stable at US\$494/MT; in contrast, urea fell sharply by 12.5% month-on-month to US\$720/MT after peaking in April, though it remained nearly 10% higher than a year earlier. **Across Africa, fertilizer affordability remains a major concern, particularly in East and Southern Africa, where countries such as Uganda, Rwanda, Malawi, and Mozambique have recorded steep increases in DAP, NPK, and urea prices, reflecting tight market conditions.** In contrast, fertilizer markets in West Africa have been relatively stable, with modest price movements in Nigeria and unchanged prices in Ghana. Overall, the continued price volatility highlights the importance of expanding regional fertilizer production, strengthening intra-African trade, and improving market coordination to enhance resilience and reduce import dependence.
- **A strong El Niño is expected to persist through late 2026 and early 2027, posing significant risks to agriculture, food security, and livelihoods across Africa.** Eastern and Southern Africa are likely to experience below-average rainfall, higher temperatures, drought, and water shortages, while parts of the Horn of Africa face an increased risk of flooding and severe storms. Countries most vulnerable include Kenya, Uganda, Ethiopia, Sudan, South Sudan, Somalia, Madagascar, Malawi, Mozambique, Zimbabwe, Nigeria, and Cameroon. The resulting impacts could include reduced crop yields, livestock losses, food price inflation, water stress, pest and disease outbreaks, and increased humanitarian needs, particularly among smallholder farmers and vulnerable communities. As climate shocks intensify, millions of people could face heightened food insecurity, displacement, and livelihood disruptions, underscoring the need for early preparedness and resilience-building measures.

### Food Commodity Prices Updates

- **Across Eastern Africa, staple food markets generally eased in June 2026 as harvest arrivals improved food availability across the region.** Maize prices fell sharply in Ethiopia (-32.9% month-on-month), Tanzania (-13.3%), Uganda (-4.3%), Kenya (-1.0%), and Rwanda (-1.6%), while South Sudan remained under pressure with prices rising by 4.3% month-on-month and 34.9% year-on-year. Rice markets were relatively stable, with declines in Tanzania (-5.4%) and Rwanda (-2.6%) offset by modest increases elsewhere, although Rwanda's rice prices remained 32.5% above year-earlier levels. Bean prices declined in Kenya (-3.1% to -3.4%) and Rwanda (-3.1%), remained unchanged in Tanzania, but surged by 16.8% in Uganda despite staying 4.2% below last year's levels. Wheat prices dropped significantly in Ethiopia (-17.3%) following improved Belg harvest supplies, while Kenya remained stable

(-0.1%), underscoring broad regional market easing except in South Sudan, where inflationary and supply constraints persisted.

- **Southern Africa's staple food markets showed mixed trends in June 2026, reflecting uneven supply conditions across the region.** Maize prices declined significantly in Malawi (-7.9% month-on-month) and Zambia (-12.5%) due to improved harvests and increased market supplies, while Mozambique recorded a sharp increase (+44.2%), indicating tightening availability and localized market disruptions. Rice prices generally eased, led by Mozambique (-15.7%), with smaller declines in Malawi (-4.8%) and Zambia (-1.8%). Bean prices were mixed, rising in Mozambique (+9.4%) and Malawi (+6.0%) but declining in Zambia (-3.9%), suggesting varying supply dynamics. Overall, annual price trends remained downward, particularly for maize in Zambia (-53.4% year-on-year), supported by above-average regional cereal production, including a record maize harvest in Zambia and strong output in South Africa, although potential El Niño-related risks to the 2026/27 season, warrants close monitoring.
- **West Africa's staple food markets were generally stable in June 2026, supported by improved food availability and adequate market supplies.** Maize prices declined across most countries, with Ghana recording the sharpest annual drop (-57% year-on-year), while Nigeria was the only major market to register a notable monthly increase (+8.3%) due to tightening supplies, high transport costs, and insecurity. Rice prices remained broadly stable, with modest increases in Ghana and Nigeria and declines in Mali, Niger, Burkina Faso, and Togo (-7%). Millet and sorghum prices were generally lower than a year earlier, although localized increases in Niger and Nigeria pointed to emerging supply pressures. Overall, staple food prices remained well below 2025 levels, while favorable growing conditions supported cereal development despite delayed rainfall and persistent insecurity in parts of the Sahel and northeastern Nigeria.

## Food Security Updates

- **Across East Africa, food security conditions in June 2026 reflected a mix of seasonal improvements and persistent humanitarian concerns.** Favourable rainfall and the onset of harvests in parts of Ethiopia, Kenya, Tanzania, and Uganda improved crop production prospects, labour opportunities, and food availability, helping to stabilize or improve food security outcomes in some agricultural areas. However, acute food insecurity remained widespread in conflict-affected, pastoral, and displacement-prone areas, driven by insecurity, high food prices, weak purchasing power, climate shocks, and limited livelihood recovery. Crisis (IPC Phase 3) and Emergency (IPC Phase 4) outcomes persisted across parts of Ethiopia's north and pastoral south, Kenya's pastoral counties and refugee settlements, and among vulnerable populations in Uganda, particularly refugees and households in Karamoja. Tanzania experienced seasonal food insecurity linked to poor production and economic constraints, although harvests were expected to improve conditions significantly. South Sudan remained the region's most severe hotspot, with widespread Emergency (IPC Phase 4) outcomes, localized Catastrophe (IPC Phase 5), extremely high levels of acute malnutrition, and a credible risk of Famine in some conflict-affected areas. Overall, conflict, displacement, climatic shocks, high food and fuel prices, and constrained incomes continued to drive substantial humanitarian needs across the region, despite expected seasonal improvements in food availability in several countries.
- **Southern Africa's food security situation showed overall improvement during the 2026 harvest period, driven by better agricultural production and increased household food stocks in countries such as Malawi, Zambia, and parts of Zimbabwe and Mozambique.** In Malawi and Zambia, improved harvests and enhanced food access reduced the severity of food insecurity compared with previous drought-affected years, although localized pockets of Crisis (IPC Phase 3) persisted due to poverty, climatic shocks, flooding, pest infestations, and macroeconomic pressures. In Zimbabwe, favourable harvests improved food availability and supported Minimal (IPC Phase 1) outcomes in surplus-producing areas, but food security is expected to deteriorate in deficit-producing regions as household stocks decline and market dependence increases, with many areas projected to move into Crisis (IPC Phase 3) from October 2026. Mozambique presents the most mixed outlook, with conflict-affected areas of Cabo Delgado and northern Nampula continuing to face Crisis-level food insecurity due to insecurity, displacement, and disrupted livelihoods, while southern and central regions have benefited from improved production and seasonal income. Across the region, high food prices, weak purchasing power, recurrent climatic shocks, and constrained livelihood opportunities remain key drivers of vulnerability, while the ongoing El Niño event poses a significant risk to the 2026/27 agricultural season through delayed rainfall, reduced labour opportunities, and the potential for below-average production, threatening to reverse recent food security gains.
- **Across West Africa, food security conditions are expected to remain under significant pressure through late 2026 and early 2027, driven by a combination of conflict, displacement, high food prices, weak household**

**incomes, and localized climate shocks.** Northern and eastern Burkina Faso, northern Mali, conflict-affected areas of Niger, northern Nigeria, and parts of northern Togo are expected to experience the most severe outcomes, with Crisis (IPC Phase 3) and localized Emergency (IPC Phase 4) conditions persisting due to insecurity that continues to restrict access to farmland, disrupt markets and livelihoods, and displace populations. Although the arrival of harvests from October onward is expected to improve food availability and ease conditions in some areas, agricultural production remains constrained by insecurity, below-average rainfall prospects, flooding, limited access to inputs, and rising production costs. Across the region, declining household food stocks, increased dependence on markets, inflationary pressures, and reduced purchasing power are expected to sustain elevated food assistance needs, particularly during the lean season, with millions of vulnerable households, including internally displaced persons and poor rural communities, requiring continued humanitarian support to meet their basic food needs.

## Food Trade Updates

- **Ethiopia and Kenya have introduced a formal cross-border trade framework that allows licensed residents living near official border crossings to legally trade approved goods worth up to US\$1,000 per month through regulated channels.** Designed to support local livelihoods, strengthen supply chains, and curb informal trade and smuggling, the scheme covers designated border zones, prioritizes women and vulnerable groups, and permits trade in selected livestock, agricultural products, and consumer goods. All transactions must pass through official customs posts, with traders required to declare goods and comply with applicable taxes and regulations, providing a structured and monitored alternative to long-standing informal cross-border commerce.
- **Côte d'Ivoire, Ghana, Togo, Benin, and Nigeria have officially launched the Abidjan–Lagos Corridor Management Authority (ALCoMA) to oversee the development and long-term management of the 1,028-kilometre Abidjan–Lagos Multimodal Corridor.** Expected to be operational by 2030, the project will feature a six-lane coastal highway and a parallel high-speed railway linking five of West Africa's largest economies, improving the movement of people, goods, and services along a key trade route. The corridor is projected to generate more than US\$16 billion in annual trade and about US\$1.3 billion in toll revenues, while boosting regional integration, industrialization, job creation, and intra-African trade under the AfCFTA, ultimately benefiting over 500 million people across the region.

# Introduction

The AGRA Food Security Monitor reviews and discusses changes in selected variables and their implications for food trade, and food and nutrition security. The discussions presented here focus on selected countries of interest to AGRA: East Africa (Ethiopia, Kenya, South Sudan, Rwanda, Tanzania and Uganda), Southern Africa (Malawi, Mozambique, Zambia and Zimbabwe), and West Africa (Burkina Faso, Côte d'Ivoire, Ghana, Mali, Niger, Nigeria and Togo).

## Food Security Dashboard

The Food Security Dashboard summarises trends in the number of people experiencing IPC/CH Phase 3+ or Equivalent (**Table 2**) and tracks average changes in food prices over the past year (**Table 1**) across 17 countries in Eastern, Southern, and Western Africa.

Based on the June 2026 IPC/CH Phase 3+ estimates (**Table 2**), Nigeria has by far the largest number of people facing Crisis or worse food insecurity, with 36.3 million people, followed by South Sudan (7.9 million), Kenya (4.1 million), Malawi (4.0 million), and Mozambique (3.5 million). At the other end of the scale, the lowest absolute numbers are observed in Togo (0.33 million), Uganda (0.47 million), and Tanzania (0.51 million). In proportional terms, South Sudan faces the most severe burden, with 55% of its population in IPC/CH Phase 3+, far exceeding all other countries. Uganda (32%) has the second-highest proportion, followed by Kenya and Malawi (22% each), while Mozambique (18%), Zambia (17%), Nigeria (16.7%), and Zimbabwe (16%) also face significant population-level food insecurity burdens. By contrast, Ghana (4%), Côte d'Ivoire (5%), Togo (5%), and Tanzania (5%) have the lowest proportional burdens among the countries listed. Overall, while Nigeria accounts for the largest number of food-insecure people, the most severe population-wide impacts are concentrated in South Sudan and several East and Southern African countries, where a much larger share of the population is experiencing Crisis or worse food insecurity.

**Table 1** highlights diverging average maize price trends across African markets, with continued price declines across much of West and Southern Africa contrasting with rising prices in several East African countries. In West Africa, average maize prices in local currencies fell significantly over both the six-month and annual periods, particularly in Ghana (-27.7% over six months; -57.0% year-on-year), Nigeria (+3.7% over six months but -36.2% year-on-year), Niger (-11.1%; -39.0%), Togo (-11.8%; -34.8%), and Mali (-5.1%; -26.4%), suggesting improved market supplies and easing food price pressures. An exception is Burkina Faso, where maize prices surged by 52.8% over six months and 78.7% year-on-year, indicating severe market stress and supply constraints.

In East Africa, maize prices remained elevated in several markets. South Sudan recorded the strongest increases, with prices rising 24.2% over six months and 34.9% year-on-year, reflecting ongoing conflict-related disruptions and supply shortages. Kenya (+2.5% over six months) and Uganda (+6.4%) also registered recent increases, although prices remained below year-ago levels in both countries. Tanzania recorded substantial declines of 18.8% over both six months and year-on-year, while Rwanda also showed relatively stable conditions, with a slight 2.6% decline over six months but a 4.9% increase year-on-year. Ethiopia's prices also fell by 10.7% over six months and remained unchanged compared to a year earlier, indicating some recent market easing.

Southern Africa presents a mixed picture. Malawi (-41.1% over six months; -26.8% year-on-year), and Zambia (-20.2%; -53.4%), pointing to improved availability and easing inflationary pressures. In contrast, Mozambique experienced a modest 2.7% increase over six months and a sharp 51.2% rise year-on-year, suggesting that recent stabilization has followed an earlier period of significant inflation. Overall, the data indicate easing maize prices across most West African and several Southern African markets, while South Sudan and, to a lesser extent, Kenya, Uganda, and Mozambique remain key hotspots of sustained price pressure.

**Table 1: Changes in Average Maize Prices (Local Currency)**

| Country      | Commodity Price Changes (%) in the last 6 months |   | Commodity Price Changes (%) in the last 1 year |   |
|--------------|--------------------------------------------------|---|------------------------------------------------|---|
| Burkina Faso | 52.77                                            | ↑ | 78.74                                          | ↑ |
| Ethiopia     | -10.65                                           | ↓ | 0.00                                           | ● |
| Ghana        | -27.72                                           | ↓ | -57.01                                         | ↓ |
| Kenya        | 2.49                                             | ↑ | -2.70                                          | ↓ |

**Figure 1** shows that maize and rice prices (in USD) generally declined across most monitored African markets between May and June 2026, although significant variations persist. For maize, South Sudan remained the most expensive market at USD 1,135/MT, followed by Zimbabwe at USD 819/MT, with both prices unchanged from May. In contrast, Ghana (USD 241/MT), Niger (USD 243/MT), Tanzania (USD 248/MT), and Nigeria (USD 255/MT) recorded some of the lowest maize prices. The largest month-on-month decline was observed in Ethiopia, where maize prices fell by 34%, while Zambia was the only market to register a sharp increase (+44%), and Nigeria recorded a more modest increase of 8%. For rice, Zambia remained the highest-priced market at USD 2,295/MT, followed by Zimbabwe (USD 2,060/MT) and Malawi (USD 1,951/MT), while Nigeria continued to record the lowest rice price at USD 481/MT. Rice prices declined in most countries, with the steepest drop recorded in Mozambique (-16%), followed by Togo (-7%) and Tanzania and Malawi (-5% each). However, prices increased slightly in Ghana (+5%) and Nigeria (+4%), while remaining stable in Kenya, South Sudan, Zimbabwe, and Zambia. Overall, the data indicate easing cereal prices (in USD/MT) across much of the region, although exceptionally high maize prices in South Sudan and elevated rice prices in Southern Africa continue to signal localized food affordability challenges.

Figure 1: The Prices of Maize and Rice Across All Monitored Countries (USD/MT)

| Maize              | June | May  | % Increase/decrease |

## Global Market Update

### Global Food Commodity Price Trends

The FAO Food Price Index (FFPI) (**Figure 2**) averaged 130.3 points in June 2026, down 0.3% from May but 1.7% higher than a year earlier, as lower prices for cereals, dairy, and sugar offset gains in vegetable oils and meat. Global cereal prices declined on strong harvest prospects and ample supplies, while sugar prices fell due to increased production and exports from Brazil. In contrast, vegetable oil prices rose on tighter palm oil availability and strong biofuel demand, and meat prices reached a record high, driven by higher poultry and bovine meat prices. Dairy prices continued to soften across most products as improving milk supplies and export availability outweighed demand in key markets.<sup>1</sup>

As of 30 June, the International Grains Council (IGC) Grains and Oilseeds Index (GOI) (**Table 3**) stood at 224.2, declining by 1.4% month-on-month but remaining 5.8% higher year-on-year, indicating that while grain and oilseed markets experienced some short-term weakness, prices generally remained above year-ago levels. Among the major commodities, rice was the only commodity that rose by 3% over the month and 3.8% year-on-year, suggesting firm demand or supply constraints. In contrast, barley recorded the steepest monthly decline (-6.4%), although it still rose by 4.9% year-on-year. Wheat and maize also weakened during the month, falling by 2.8% and 2.1%, respectively, but both remained higher than a year ago. In the oilseeds market, soybeans showed the strongest annual increase (+8.9%), despite a modest monthly decline (-0.5%), highlighting continued underlying strength in soybean markets.

### Fertiliser Prices Outlook

Global fertilizer markets are entering a new phase of uncertainty: while the reopening of the Strait of Hormuz has restored trade flows, reduced freight costs, and resumed Iranian urea exports, fertilizer supply chains remain vulnerable to geopolitical tensions, policy changes, production costs, and climate risks. Increased urea availability from Iran and China has pushed global urea prices lower amid weak demand, whereas phosphate prices remain elevated due to persistently high sulfur costs, which continue to constrain production and keep supplies tight. For Africa, which relies heavily on fertilizer imports, this volatility underscores the need to strengthen regional production, boost intra-African trade, and improve market coordination to build a more resilient and self-sufficient fertilizer sector.

Following the interim agreement on 15 June 2026, fertilizer shipments through the Strait of Hormuz have begun to recover after being severely disrupted during the 3½-month conflict. Since the agreement, around 640,000 metric tons of sulphur and 427,000 metric tons of urea have moved through the waterway, a significant increase compared with

<sup>1</sup> <https://www.fao.org/worldfoodsituation/foodpricesindex/en/>

<sup>2</sup> Ibid

<sup>3</sup> <https://www.igc.int/en/markets/marketinfo-goi.aspx>

volumes shipped during the conflict. The resumption of trade has eased concerns over a potential global food price crisis that could have resulted from fertilizer shortages and reduced crop yields.<sup>4</sup> However, analysts caution that recovery remains slow, with more than 500 vessels still stranded in the Gulf, shipping traffic well below pre-war levels, and limited new fertilizer sales taking place. As a result, fertilizer markets are expected to remain tight in the near term despite the gradual improvement in maritime flows.

As at June end, global fertilizer prices showed mixed movements, with most products remaining elevated compared to a year earlier despite some recent stabilization (**Figure 3**). DAP prices stood at US\$910/MT, declining marginally by 0.4% month-on-month but remaining 12.3% higher year-on-year, while MAP reached US\$954/MT, recording a slight monthly increase of 0.1% and the strongest annual gain among phosphate fertilizers at 12.8%. Potash prices remained virtually unchanged over the month (0.0%) at US\$494/MT, posting a modest annual increase of 2.7%, indicating relatively stable market conditions. In contrast, urea experienced the sharpest monthly decline, falling 12.5% from May to US\$720/MT, although prices remained 9.8% above their levels a year earlier. The significant drop in urea follows a period of strong price increases earlier in 2026, when values peaked at US\$866/MT in late April. Overall, the data suggests that fertilizer markets are beginning to ease after sustained price increases over the past year, particularly for urea, while phosphate fertilizers such as DAP and MAP continue to reflect underlying market strength and tighter supply-demand balances.

At country level (**Table 4**), fertilizer prices remain elevated across Africa, with the sharpest increases recorded in East Africa. In Uganda, DAP prices surged by 59.5% over the past month and 111.4% over six months, while NPK prices rose 35.8% month-on-month and 108.9% year-on-year, reflecting severe market tightness. Rwanda also recorded strong annual increases, with NPK and urea prices up 45.4% and 44.7% year-on-year, respectively, while Malawi saw NPK and urea prices rise by 6.6% and 5.5% over the past month, and 24.9% and 33.8% year-on-year. Mozambique continued to experience rapid inflation, with NPK and urea prices increasing by 28.7% and 27.3% month-on-month, and 56.5% and 93.8% year-on-year, respectively. By contrast, Zambia recorded significant declines, with NPK and urea prices falling 7.6% and 18.1% over the past month, while Ghana's fertilizer prices remained unchanged and Nigeria experienced only modest movements, with urea prices up 13.8% year-on-year and NPK up 0.9% year-on-year. Overall, the data highlight persistent fertilizer affordability challenges across much of East and Southern Africa, while markets in West Africa remain comparatively stable.

## Update on the Impacts of the US–Iran Crisis

The Iran war has precipitated a global input crisis by severely disrupting energy and fertilizer supply chains, particularly following the closure of the Strait of Hormuz<sup>6</sup>. This chokepoint is critical given that the Middle East supplies roughly one-third of global urea exports, and since late February 2026, approximately 3.9 million tonnes, about 30%, of Gulf fertilizer exports have been suspended.<sup>7</sup> Consequently, urea prices doubled within weeks, while phosphate prices also increased, sharply raising agricultural input costs worldwide. Rising input costs are transmitted through the food system, amplifying risks to food security. Elevated prices for fertilizer, energy, and transport discourage fertilizer use, depress crop yields, and increase production costs, which collectively place upward pressure on food prices. These effects are intensified by ongoing supply constraints, higher prices for key inputs such as natural gas and sulphur, and reduced production rates in affected regions. Although fertilizer prices moderated slightly in May 2026, partly due to China lifting export restrictions, persistent supply disruptions and price volatility remain significant risks, especially if the conflict continues<sup>8</sup>.

Crucially, the burden of this emerging crisis falls disproportionately on poorer countries and vulnerable households, which already spend a large share of their income on food. The trajectory from an input crisis to a full-scale food crisis will depend on the duration and severity of the conflict, but risks are clearly escalating. Prolonged disruptions could lead to significant fertilizer shortages, reduced agricultural output, and worsening food insecurity, particularly in structurally vulnerable regions. IFPRI finds that disruptions linked to the Iran war, especially through the Strait of Hormuz, have driven sharp increases in global fuel and fertilizer prices, both of which are essential for food production and distribution<sup>9</sup>. Developing countries are especially exposed because of their heavy reliance on imported fuel and fertilizers, meaning global price spikes quickly translate into higher domestic costs, currency pressures, and rising food prices. Using economywide models covering 20 developing countries, IFPRI shows that while overall macroeconomic impacts may appear modest, they are uneven and disproportionately affect agriculture and low-income households.

These price shocks propagate through supply chains by raising transport and production costs, while higher fertilizer prices reduce application rates and lower yields. As a result, food availability declines and affordability worsens, even in cases where GDP losses remain relatively small. In human terms, the consequences are substantial: IFPRI estimates that more than 20 million additional people could fall into poverty, while around 2.5 million more may face undernourishment, illustrating how relatively small percentage shocks can translate into large absolute increases in hardship.

<sup>6</sup> [Iran War: From Fertilizer To Food Crisis? – Welthungerhilfe](#)

<sup>7</sup> Ibid

<sup>8</sup> Ibid

<sup>9</sup> [Country-level analysis: Iran War increasing global poverty and food insecurity | IFPRI](#)

At the country level, IFPRI's analysis of Nigeria illustrates how these global shocks are transmitted domestically through interconnected fuel, fertilizer, and food price channels<sup>10</sup>. Nigeria remains highly vulnerable due to its reliance on imported refined fuel and key fertilizer inputs, despite being an oil producer. This dual structure means that, while higher global prices could boost export revenues, they simultaneously increase domestic costs and inflationary pressures. Food inflation in Nigeria had already peaked at about 40.9% in June 2024, driven by earlier global shocks and domestic policy reforms, before easing to roughly 21–23% by mid-2025. However, renewed increases in fuel and fertilizer prices linked to the Iran conflict threaten to reverse this improvement. Rising fuel costs increase transport and processing expenses, while higher fertilizer prices constrain agricultural output, reinforcing upward pressure on food prices and household living costs. Although IFPRI modelling suggests Nigeria could experience net welfare gains if higher export earnings outweigh rising domestic costs, these benefits are uneven and delayed. In the short term, households face rising prices and reduced purchasing power, underscoring the complexity of the shock. The report concludes that Nigeria's policy response will be critical in balancing immediate inflation risks with longer-term opportunities to strengthen domestic refining, fertilizer production, and economic resilience.

At the farm level, similar dynamics are evident in countries such as Mozambique, where the closure of the Strait of Hormuz is already reshaping farmers' expectations regarding input access and affordability. Mozambique depends on imports routed through this corridor, including about 22% of its fertilizers, making it highly exposed to supply disruptions and price increases.<sup>11</sup> Farmers, particularly during key agricultural periods of harvest and planting, face growing uncertainty about whether they can access or afford sufficient fertilizer. These pressures are compounded by a domestic fuel crisis marked by rising diesel and petrol prices and inconsistent supply, which increases transport costs for both inputs and outputs. Evidence from farming communities indicates that fertilizer prices have already risen by 10–20% in some areas, while transport disruptions are limiting market access and raising operational costs.<sup>12</sup> In response, farmers are adjusting behaviour, delaying planting, reducing fertilizer use, or selling produce early at lower prices to secure cash, often at the expense of future productivity and income. Although fertilizers remain available in some areas, affordability is deteriorating rapidly, and concerns about further shortages and price spikes are intensifying. These trends point to the risk of reduced input use, lower yields, and worsening food security outcomes, particularly for smallholder farmers. Taken together, the evidence highlights how global geopolitical shocks are translating into tangible, on-the-ground impacts, reinforcing vulnerabilities across food systems and threatening agricultural livelihoods.

Fuel prices across Africa (**Table 5**) showed mixed movements between May and June but remained significantly higher than in March in most countries. Rwanda recorded the largest overall increases, with petrol and diesel prices rising by 48% and 50%, respectively, between March and June, while Tanzania also experienced substantial increases of 39% for petrol and 46% for diesel, despite slight monthly declines in June. Kenya and Uganda continued to face elevated fuel costs, with diesel prices up 34% and 37% respectively from March levels, reflecting persistent pressure on transport and logistics costs. In Southern Africa, Mozambique saw the sharpest diesel inflation, with prices surging 85% between March and June, while petrol increased by 14%. Malawi recorded more moderate increases of 13% for petrol and 28% for diesel, although both fuels declined month-on-month in June. By contrast, Zambia and Nigeria experienced price easing, with petrol prices falling by 2% and remaining unchanged respectively between March and June, while diesel prices rose only 21% in Zambia and declined 10% in Nigeria. Ghana registered moderate increases of 25% in petrol and 11% in diesel. Overall, diesel prices generally increased more sharply than petrol across most countries, highlighting continued upward pressure on freight, production, and food distribution costs, particularly in East and Southern Africa.

## Update on El Niño conditions

A strong El Niño event is developing and is expected to persist through late 2026 and early 2027, with the World Meteorological Organization estimating an 80–90% probability of occurrence and NOAA indicating a 63% chance of a very strong event. Across Africa, the phenomenon is expected to significantly disrupt weather patterns, bringing below-average rainfall and higher temperatures across much of Eastern and Southern Africa, while increasing the risk of heavy rainfall, flooding, and severe storms in parts of the Horn of Africa. These climate shocks threaten agricultural production, water resources, and livelihoods, particularly for millions of smallholder farmers who depend on rainfed agriculture.

According to FAO and WFP assessments, the country's most vulnerable to El Niño-related impacts include Kenya, Uganda, Ethiopia, Sudan, South Sudan, Somalia, Madagascar, Malawi, Mozambique, Zimbabwe, Nigeria, and Cameroon. In the Greater Horn of Africa, prolonged dry spells, delayed rainfall, and rising temperatures are expected to reduce cereal production, deteriorate pasture conditions, and constrain water availability. Southern Africa faces a heightened risk of agricultural drought, heatwaves, and significant reductions in maize and livestock production, raising concerns as several countries are still recovering from the severe 2023–2024 El Niño episode. Meanwhile, West Africa and the Sahel could experience more erratic rainfall patterns, localized droughts, and increased production uncertainty.

The impacts are expected to extend beyond agriculture and place additional strain on food systems and economies across the continent. Reduced crop production could drive food price inflation, increase livestock feed costs, and deepen import dependence, while water shortages may affect irrigation, hydropower generation, and household access to water. Livestock producers are likely to face declining pasture availability, animal health challenges, and increased mortality rates, while climate anomalies could heighten the risk of pest and disease outbreaks, including fall armyworm and desert locust infestations. In fragile and conflict-affected areas, these pressures may exacerbate displacement, resource competition, and humanitarian needs, underscoring the importance of early preparedness and anticipatory action to safeguard food security and livelihoods through 2027.

# East Africa Food Insecurity Updates

## Food Security Outlook

Figure 4: East African Countries Food Security Outlook, June 2026

In June 2026, food security conditions in **Ethiopia** remained fragile, with Crisis (IPC Phase 3) outcomes widespread and Emergency (IPC Phase 4) conditions persisting in some of the most vulnerable areas.<sup>13</sup> While generally average March–May belg rains improved crop production prospects, labour opportunities, and food access in several belg-dependent areas, particularly in eastern Oromia, the onset of the lean season was expected to worsen food insecurity in conflict-affected parts of Amhara and Tigray, where continued insecurity, displacement, disrupted trade, reduced income opportunities, and high food prices constrained household access to food. An estimated 750,000 displaced people in Tigray remained particularly vulnerable, with some households facing Emergency outcomes.<sup>14</sup> In the pastoral south and southeast, food insecurity was also expected to remain at Crisis levels due to lingering effects of previous droughts, below-average

livestock productivity, and localized rainfall deficits despite some seasonal improvements. Overall, conflict, displacement, high food prices, and limited livelihood recovery remained the main drivers of acute food insecurity across Ethiopia in June 2026.

In June 2026, **Kenya's** food security situation showed mixed trends. Favourable March–May long rains improved crop production prospects, agricultural labour opportunities, and rangeland conditions in many areas, supporting Stressed (IPC Phase 2) outcomes in most marginal agricultural zones and improving food availability through expected June–August harvests.<sup>15</sup> However, Crisis (IPC Phase 3) conditions were expected to persist across most pastoral counties, where below-average herd sizes, limited milk production, constrained livestock sales, and elevated staple food prices continued to reduce household purchasing power and food access. As the June–September dry season progresses, declining forage and water availability are expected to weaken livestock productivity and incomes, sustaining food consumption gaps and reliance on coping strategies. Refugees in Dadaab and Kakuma camps and Kalobeyei settlement were also projected to remain in Crisis! (IPC Phase 3!), dependent on ongoing humanitarian assistance. According to IPC analysis, an estimated 3.3 million people were classified in IPC Phase 3 or worse, including around 400,000 people in Emergency (IPC Phase 4), highlighting continued food security concerns despite generally favourable rainfall conditions.<sup>16</sup>

In **Tanzania**, food security conditions were strained by prolonged dry spells, flooding, high food prices, weak purchasing power, and limited income opportunities, particularly in vulnerable rural districts.<sup>17</sup> During the February–May lean season, approximately 1 million people (10% of the analysed population) faced Crisis (IPC Phase 3) food insecurity, driven by reduced crop production and constrained access to food and income among households reliant on agricultural labour, livestock, and crop farming. However, the onset of the Masika and Msimu harvests from June was expected to improve food availability and household access to food, reducing the number of people facing Crisis-level food insecurity or worse to about 507,000 (5% of the analysed population) through January 2027.

**South Sudan's** food security situation remains extremely severe, with 8.0–8.99 million people expected to require food assistance through September, driven by conflict, displacement, economic deterioration, high food and fuel prices, flooding, and emerging drought conditions.<sup>18</sup> Emergency (IPC Phase 4) outcomes are projected across 26 counties,

<sup>13</sup> [Ethiopia Key Message Update, May - June 2026: Early lean season food price surge reduces food access, except in belg-areas - Ethiopia | ReliefWeb](#)

<sup>14</sup> [Ethiopia | FEWS NET](#)

<sup>15</sup> [Kenya | FEWS NET](#)

<sup>16</sup> [IPC Country Analysis | IPC - Integrated Food Security Phase Classification](#)

<sup>17</sup> [Tanzania: Acute Food Insecurity Situation for February–May 2026 and Projection for June 2026–January 2027 | IPC - Integrated Food Security Phase Classification](#)

<sup>18</sup> <https://fewsn.net/east-africa/south-sudan>

while some inaccessible areas of Jonglei and Upper Nile are expected to face Catastrophe (IPC Phase 5) due to disrupted livelihoods, limited humanitarian access, and ongoing insecurity. Acute malnutrition has reached extremely critical levels (GAM  $\geq 30\%$ ) in several counties, including Akobo, Nyirol, Fangak, and Nasir, where conflict, poor health services, disease outbreaks, and inadequate water and sanitation conditions have severely undermined nutrition outcomes. Looking ahead, food security is expected to remain precarious through January as below-average harvests, conflict-related displacement, flooding, and El Niño-related weather impacts limit food production, while a credible risk of Famine (IPC Phase 5) persists in Akobo, Nyirol, Nasir, and Ulang if conflict escalates further and humanitarian and market access remain constrained.

**Uganda's** overall food security situation was relatively stable in most agricultural areas due to generally near-average seasonal rainfall and the start of first-season harvests, but significant pockets of acute food insecurity persisted among refugees and households in Karamoja.<sup>19</sup> FEWS NET estimated that 1.0–2.49 million people were experiencing Crisis (IPC Phase 3) or worse outcomes, with needs peaking during the April–June lean season before harvests began.<sup>20</sup> Refugees, primarily from South Sudan and the DRC, faced restricted access to land and income-generating opportunities, while households in Karamoja continued to struggle with chronic poverty, limited agricultural potential, reduced livestock holdings, and constrained access to food. Although rainfall supported crop recovery and near-average production prospects in many areas, high fuel prices, elevated food costs, and disruptions linked to Ebola-related border restrictions with the DRC negatively affected trade, market access, and labour opportunities for vulnerable households, particularly in border districts. Overall, food security conditions were expected to improve somewhat with the arrival of harvests, but acute food assistance needs remained substantial among the most vulnerable populations.

## Commodity Prices

### Key drivers of commodity prices in EA

|                                                                                     |                             |                                                                                                                                                                             |
|-------------------------------------------------------------------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | <b>Conflicts</b>            | Conflicts and insecurity persist, particularly in South Sudan and Ethiopia, hindering effective price stability and trade flows.                                            |
|  | <b>Seasonal Dynamics</b>    | Above average rainfall in some areas such as Uganda resulted to rising of Nile River water levels affecting crops in 13 counties across four states hence affecting prices. |
|  | <b>Macroeconomic Shocks</b> | South Sudan continues to experience high prices due to poor macroeconomic conditions, currency depreciation, and trade disruptions.                                         |

## Maize

**Figure 5: National average price spreads for maize across select East African Countries<sup>21</sup>**

**Figure 5** presents maize prices (USD/metric tonne) across six Eastern African countries, revealing a broad-based decline between May and June 2026. Kenya recorded the highest average maize price at USD 432.6/MT, followed closely by Uganda (USD 426.2/MT) and Rwanda (USD 420.7/MT), while Tanzania and Ethiopia registered the lowest prices at USD 247.5/MT and USD 254.0/MT respectively. The largest month-on-month decline was observed in Ethiopia, where prices fell by about 34%, followed by Tanzania with a 13%, with more moderate declines recorded in Rwanda, Uganda and Kenya; suggesting improved market supplies across the region following harvests.

**Table 6** further summarizes maize prices in local currencies across East African countries, with substantial

price declines in Ethiopia, Tanzania, and Uganda, relatively stable prices in Kenya and Rwanda, and continued upward pressure in South Sudan. In **Ethiopia**, the national average retail price of white maize stood at ETB 4,074.17 per 100 kg, representing a sharp 32.9% month-on-month decline. Prices were also 20.5% lower than three months ago and 10.7%

<sup>19</sup> [Uganda Key Message Update: High fuel prices and restrictions intended to curb Ebola will affect food access, May – September 2026 – Uganda | ReliefWeb](#)

<sup>20</sup> [Uganda | FEWS NET](#)

<sup>21</sup> These price spreads are calculated based on online rates at <https://www.oanda.com/currency-converter/en>

below six-month level, while remaining unchanged compared to a year earlier. The steep monthly decline suggests a significant improvement in maize availability following recent harvests.

In **Kenya**, maize prices declined modestly by 1.0% during the month to KES 55.60/kg. Prices were also 2.4% lower than three months ago, although they remained 2.5% higher than six months earlier. Compared to the same period last year, maize prices were 2.7% lower, indicating generally stable market conditions. In **Rwanda**, maize prices fell by 1.6% month-on-month to RWF 614.11/kg. Despite the recent decline, prices were 5.3% higher than three months ago and 4.9% above year-earlier levels, suggesting that maize markets remain relatively firm compared to neighboring countries.

**South Sudan** continued to experience rising maize prices. The national average retail price increased by 4.3% during the month to SSP 5,192.46/kg. Strong increases were also recorded over longer periods, with prices rising by 26.8% over three months, 24.2% over six months, and 34.9% year-on-year. These increases point to persistent supply constraints and inflationary pressures in the maize market.

In **Tanzania**, wholesale maize prices (Mahindi) declined significantly by 13.3% month-on-month to TZS 65,000 per 100 kg. Prices were also 25.7% lower than three months ago, 18.8% below six-month levels, and 18.8% lower than a year earlier. The broad-based declines indicate improved market supplies and easing price pressures. In **Uganda**, maize prices decreased by 4.3% during the month to UGX 1,555.08/kg. Prices were also 8.7% lower than three months ago. However, they remained 6.4% higher than six months earlier, suggesting that part of the earlier gains have recently been reversed. Compared to a year ago, maize prices were 20.0% lower, reflecting improved market conditions.

**Table 6: Percentage changes in maize prices in East Africa<sup>22</sup>**

| Country     | Crop                  | Market                                 | Last Price | 1 Month % | 3 Months % | 6 Months % | 1 Year % |

 ↘ = low decrease (0–5%), ↓ = moderate decrease (5–15%), ↓ = high decrease (>15%)

## Rice

**Figure 6: National average price spreads for rice across select East African Countries<sup>23</sup>**

**Figure 6** presents rice prices (in USD per metric tonne) cross select Eastern African countries, with Kenya and Rwanda maintaining the highest average prices at USD 1,398.9/MT and USD 1,368.5/MT respectively. Uganda's rice price increased by modest 3% to USD 1,020.6/MT suggesting stronger domestic demand and reduced market supplies. Meanwhile, Tanzania continued to record the lowest average price at USD 828.3/MT, a 5% month-on-month decline suggesting improved availability of rice supplies.

**Table 7** shows mixed short-term movements in local-currency rice prices across East Africa, with relatively small month-on-month price movements in most countries. While prices declined in Rwanda and Tanzania, modest increases were recorded in Kenya, South Sudan,

and Uganda. Longer-term trends, however, reveal notable differences across markets. In **Kenya**, both rice varieties recorded marginal monthly increases. Komboka rice rose by 0.04% to KES 123.02/kg, while Pishori rice increased by 0.55% to KES 179.81/kg. Despite these slight gains, Komboka prices remained 1.6% lower than three months ago and

<sup>22</sup> Author's construction based on 1) AGRA MIS data for Rwanda and Uganda; 2) FAO data for South Sudan; 3) National MIS Ethiopia, Kenya & Tanzania

<sup>23</sup> These price spreads are calculated based on online rates at <https://www.oanda.com/currency-converter/en>

3.1% below six-month levels, although they were 4.1% higher than a year earlier. Pishori prices were 1.2% higher than three months ago and 1.8% above six-month levels but remained 5.0% below year-earlier levels.

In **Rwanda**, rice prices declined by 2.6% month-on-month to RWF 1,997.78/kg. However, prices remained significantly higher over the medium term, increasing by 3.7% over three months and 11.6% over six months. On an annual basis, prices were 32.5% higher than a year earlier, the strongest year-on-year increase among the countries analyzed, indicating sustained market tightness despite the recent decline. In **South Sudan**, rice prices increased slightly by 0.7% during the month to SSP 3,211.64/kg. Stronger gains were recorded over longer periods, with prices rising by 10.9% over three months, 6.0% over six months, and 12.2% year-on-year. These increases suggest continued upward pressure in the rice market, likely driven by supply constraints and broader inflationary factors.

**Tanzania** recorded the most pronounced decline among the monitored countries, with wholesale rice (Mchele) prices falling by 5.4% month-on-month to TZS 217,500 per 100 kg. Prices were also 14.7% lower than three months ago, 9.4% below six-month levels, and 7.5% lower than a year earlier, indicating improved market supplies from recent harvests and easing price pressures. In **Uganda**, both rice varieties remained relatively stable. Kaiseo rice increased marginally by 0.01% to UGX 3,724.44/kg, while Super rice rose by 1.1% to UGX 4,747.47/kg. Kaiseo prices were broadly stable over all time periods, posting a 0.8% annual increase, while Super rice prices were 0.6% higher than three months ago but remained 4.8% lower than six months ago and 4.4% below year-earlier levels.

**Table 7: Percentage changes in rice prices in East Africa<sup>24</sup>**

 ▢ = low decrease (0–5%), ▾ = moderate decrease (5–15%), ▽ = high decrease (>15%)

## Beans

**Figure 7: National average price spreads for beans across select East African Countries<sup>25</sup>**

**Figure 7** presents beans prices (in USD per metric tonne) across selected Eastern African markets, indicating considerable variation among countries. Kenya continued to record the highest prices for both yellow beans (USD 1,152.0/MT) and red beans (USD 932.2/MT), while Rwanda registered the lowest average price at USD 731/MT. Most markets experienced modest month-on-month declines, ranging from about 3% to 4%. In contrast, Uganda recorded a substantial increase of approximately 20%, making it the only market with a significant upward movement during the month.

**Table 8** illustrates local-currency bean prices across East African markets, highlighting mixed trends with declining prices in Kenya, stable prices in Tanzania, modest gains in Rwanda, and a sharp increase in Uganda. In **Kenya**, both

bean varieties recorded month-on-month price declines. Wairimu beans fell by 3.4% to KES 119.82/kg, while yellow beans declined by 3.1% to KES 148.07/kg. The downward trend was also evident over the medium term, with prices falling by 8–10% over three months and 11–14% over six months. Compared to a year earlier, prices were lower by 2.9% for Wairimu beans and 12.5% for yellow beans, indicating improved market availability and weaker price pressures.

In **Rwanda**, bean prices declined by 3.1% during the month to RWF 1,066.44/kg. Despite the monthly decline, prices

<sup>24</sup> Author's construction based on 1) AGRA MIS data for Rwanda and Uganda; 2) FAO data for South Sudan; 3) National MIS Ethiopia, Kenya & Tanzania

<sup>25</sup> These price spreads are calculated based on online rates at <https://www.oanda.com/currency-converter/en>

remained substantially higher than three months earlier, rising by 17.5%, and were 6.2% above year-earlier levels. These increases suggest that underlying market conditions remain relatively firm despite the recent easing. In **Tanzania**, wholesale bean prices (Maharage) remained unchanged during the month at TZS 202,500 per 100 kg. However, prices were 2.4% lower than three months ago and 11.0% below six-month level. On an annual basis, prices declined significantly by 24.3%, reflecting improved supplies and relatively weak market pressure.

**Uganda** recorded the strongest price increase among the countries analyzed. National average bean prices rose by 16.8% month-on-month to UGX 3,012.50/kg. Prices were also 1.4% higher than three months ago and 3.4% above six-month levels. Despite these recent gains, bean prices remained 4.2% lower than a year earlier, suggesting that the current increase represents a recovery from previously lower price levels rather than a sustained long-term upward trend.

**Table 8: Percentage changes in bean prices in East Africa<sup>26</sup>**

## Wheat

**Figure 8: National average price spreads for wheat across select East African Countries**

**Figure 8** presents wheat prices (in USD per metric tonne) across Kenya and Ethiopia, revealing a substantial price gap between the two countries. Kenya continued to post significantly higher prices at USD 807.8/MT, compared to USD 458.1/MT in Ethiopia. While Kenyan wheat prices remained virtually unchanged from May, Ethiopia experienced a sharp decline of nearly 19 percent, indicating improved market availability or reduced pricing pressure during the month.

**Table 9** summarises wheat prices in local currencies across two select East African countries highlighting contrasting market dynamics. Ethiopia experienced a sharp decline in wheat prices during the past month, reflecting improved market supply conditions, while Kenya's wheat market remained largely stable with only minor price fluctuations.

In **Ethiopia**, the national average retail price of white wheat stood at ETB 7,349.92 per 100 kg. Prices declined significantly by 17.3% month-on-month, representing the largest short-term change among the countries monitored. The downward trend was also evident over the medium term, with prices falling by 9.1% over three months and 6.6% over six months. The recent declines reflect improved market availability from the recent *belg* green harvest despite the local currency depreciation and fuel price upsurge in the country

In **Kenya**, the national average retail wheat price averaged KES 103.82/kg. Prices remained stable, declining marginally by 0.1% month-on-month and showing no significant change over the previous three months. However, prices were 4.1% higher than six months ago, suggesting some upward pressure earlier in the year, likely linked to import costs and exchange rate movements given the country's reliance on imported wheat. On an annual basis, wheat prices were 2.6% lower, reflecting adequate market supplies and relatively stable market conditions. Overall, Kenya's wheat market exhibited limited volatility compared to Ethiopia, with prices remaining close to their recent historical levels.

<sup>26</sup> Author's construction based on 1) FAO data for Rwanda & Uganda, 2) National MIS Kenya & Tanzania

Table 9: Percentage changes in wheat prices in East Africa<sup>27</sup>

| Country  | Crop                  | Market                              | Last Price | 1 Month % | 3 Months % | 6 Months % | 1 Year % |

## Seasonal Monitor and Cropping Conditions<sup>28</sup>

In **Eastern Africa**, rainfall deficits are increasingly affecting agricultural activities, disrupting *Belg* harvests and the development of main/Meher season crops across much of the northern part of the region. In contrast, conditions have been more favorable in southern Eastern Africa, where main-season cereal harvesting has been completed in Tanzania's unimodal areas and is progressing in the bimodal zones of Uganda, Rwanda, and Burundi. Meanwhile, crops in Somalia, Kenya, northern Uganda, and bimodal areas of Tanzania continue to develop, although below-average rainfall and emerging moisture stress are raising concerns in several areas.

The Greater Horn of Africa (GHA) Climate Outlook for 2026 warns of a sharp two-phase climate pattern across the region. From July to September (JAS), much of northern and equatorial East Africa, including Sudan, South Sudan, Ethiopia, Uganda, and western Kenya, is expected to experience significantly below-normal rainfall and above-normal temperatures, with the most severe drought risk concentrated in northern and central Ethiopia.<sup>29</sup> These dry conditions are likely to reduce water availability, lower river flows and hydropower generation, increase food insecurity, and place additional stress on livelihoods, agriculture, and livestock systems.

The outlook then shifts dramatically during the October to December (OND) season, when above-normal rainfall is forecast across Kenya, Uganda, Rwanda, Burundi, much of Somalia, Tanzania, and southeastern Ethiopia, with some areas having a greater than 90% probability of excessive rainfall. Driven largely by a strengthening El Niño event and potentially supported by a weak positive Indian Ocean Dipole, the wet season could improve soil moisture, replenish water resources, and support agricultural recovery. However, it also raises the risk of floods, landslides, crop and infrastructure damage, disease outbreaks, and disruptions to energy systems. The report highlights similarities with past El Niño years such as 1997 and 2023 and urges governments and partners to prepare for both drought impacts in the near term and flood-related emergencies later in the year.

In Kenya's North Rift region, maize farmers are facing the prospect of heavy harvest losses after a prolonged four-week dry spell, compounded by the delayed distribution of fertilizer during critical crop growth stages.<sup>30</sup> The drought has caused crops to wither across hundreds of acres, raising concerns about food security in one of the country's key agricultural zones. Agricultural officials warn that if dry conditions continue, losses could extend beyond maize to beans, tea, coffee, and horticultural crops, with significant implications for national food supplies and rural livelihoods. The situation highlights the growing impact of climate change on Kenya's farming sector and could lead to reduced yields, higher food prices, and greater economic vulnerability for households that depend on agriculture.

## Southern Africa Food Security Update

Figure 9: Southern Africa Countries Food Security Outlook, June 2026

In **Malawi**, food security conditions between April and June 2026 improved markedly as the main harvest increased household food stocks, food availability, and income from crop sales and agricultural labour.<sup>31</sup> Most areas experienced Minimal (IPC Phase 1) or Stressed (IPC Phase 2) outcomes, supported by generally average national crop production following a largely favourable 2025/26 rainy season. However, localized dry spells and flooding reduced harvests in parts of the Southern Lakeshore, Middle Shire, and Lower Shire zones, leaving some poor households unable to meet non-food needs despite having adequate food consumption. While maize prices declined with the harvest, they remained well above the five-year average, and high inflation and fuel costs continued to constrain household purchasing power, particularly in southern districts. Overall, food security conditions during April–June 2026 were significantly better than during the previous lean season, although pockets of vulnerability persisted in areas affected by weather shocks and recurring livelihood stress.

**Mozambique's** food security outlook remains mixed, with northern areas, particularly conflict-affected parts of Cabo Delgado and northern Nampula, expected to face Crisis (IPC Phase 3) outcomes through at least January 2027 due to ongoing insecurity, displacement, disrupted livelihoods, and below-average access to food and income, despite the current harvest.<sup>32</sup> In contrast, southern and central regions are projected to improve from Crisis (IPC Phase 3) to Stressed (IPC Phase 2) from July as households benefit from vegetable production, seasonal income, post-flood agricultural support, and favourable second-season harvests. However, these gains are likely to be temporary, as declining food stocks, high food prices, and weak purchasing power are expected to increase market dependence and push some districts back into Crisis conditions by October. Looking ahead, the ongoing El Niño event is expected to negatively affect the 2026/27 rainy season through delayed rainfall, below-average agricultural production, higher temperatures, and reduced labour opportunities, further weakening household resilience. Overall, FEWS NET estimates that 1.5–1.99 million people will require food assistance between December and January, with food insecurity driven by poor harvests, low food stocks, and persistent conflict-related disruptions in the north.

**Zambia's** food security conditions were generally improved compared with the drought-affected period of 2024, supported by better agricultural production and recovery in household food access.<sup>33</sup> However, vulnerability persisted in several districts due to chronic poverty, macroeconomic pressures, climatic shocks, pest infestations, and localized flooding. Many poor households continued to face difficulties meeting their food needs and protecting livelihoods, particularly in hotspot areas, with humanitarian assistance remaining necessary for populations experiencing Crisis (IPC Phase 3) conditions or worse. Overall, while food insecurity had eased significantly from the previous year, pockets of acute food insecurity remained a concern, especially among vulnerable rural households affected by weather-related shocks and limited economic opportunities

**Zimbabwe's** food security situation is expected to worsen in many deficit-producing areas as households deplete harvest stocks and become increasingly dependent on markets from October 2026, leading conditions to deteriorate from Stressed (IPC Phase 2) to Crisis (IPC Phase 3) through January 2027.<sup>34</sup> While the 2025/26 harvest improved cereal availability and contributed to seasonal declines in maize grain prices, food access remains constrained in some isolated and deficit areas where prices are still high. Poor households face weak purchasing power due to below-average incomes, limited crop and livestock sales, reduced casual labour opportunities, and above-average fuel and transport costs, despite relatively stable commodity prices and exchange rates. In contrast, most surplus-producing areas in the Mashonaland Provinces are expected to maintain Minimal (IPC Phase 1) outcomes through January 2027, supported by food stocks and income from crop sales and labour, although some less-productive communal areas may shift to Stressed (IPC Phase 2) as stocks decline. Alternative income sources such as horticulture, construction, thatch grass sales, and artisanal gold mining are providing some support, but overall livelihood opportunities remain

insufficient for many poor households, especially in southern regions where the absence of Mopane worms has further reduced seasonal income.

## Commodity Prices

### Key drivers of prices in the Southern Africa region

|                                                                                   |                             |                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <b>Seasonality Patterns</b> | Most Southern African countries are experiencing seasonal declines and stability in grain prices as the harvest season concludes despite the expected below-average harvests.          |
|  | <b>Weather Shocks</b>       | The aftermath of the cyclone, drought shocks, and heavy flooding early in the planting season led to below-average harvests from the previous season, resulting in higher food prices. |
|  | <b>Macroeconomic Shocks</b> | Poor macroeconomic conditions caused by forex shortages, power shortages, high food inflation, and high debt repayments sustain higher food prices.                                    |

## Maize

Figure 10: National average price spreads for maize across select Southern African Countries<sup>35</sup>

Figure 10 illustrates maize price movements (in USD per metric tonne) across Southern African markets highlighting contrasting market trends, with maize prices declining in Malawi and Zambia while rising sharply in Mozambique.

**Mozambique** recorded the highest maize price among the three countries, with a sharp 44% month-on-month increase to USD456/Mt. The sharp increase was likely driven by a combination of below-average harvests in key areas due to floods and drought, continued conflict-related disruptions, increased reliance on markets by affected households, and higher transport/fuel costs, which outweighed the normal seasonal downward pressure expected during harvest time.<sup>36</sup> Conversely, **Malawi** recorded 8% month-on-month price decline to USD 433/MT. However, when converted using the parallel exchange rate, the June price falls dramatically to USD 197/MT, putting Malawi's maize amongst the cheapest in the region because of increased supply from the recent harvests.

Similarly, **Zambia** experienced a moderate 11% decline in maize prices, with prices falling from USD345/MT to USD307/MT in June, suggesting improved market availability supported by recent harvest supplies entering the market.

**Table 10** summarises maize price trends across selected Southern African markets in local currencies, with sharp increase recorded in Mozambique, while Malawi and Zambia recorded significant declines. In **Malawi**, national average maize prices fell by 7.9% month-on-month to MWK 749.22/kg. The downward trend was even more pronounced over longer periods, with prices declining by 33.1% over three months and 41.1% over six months. Compared to the same period last year, maize prices were 26.8% lower, indicating improved market availability and reduced supply constraints. In **Mozambique**, white maize prices increased sharply by 44.2% during the month, reaching MZN 28.81/kg. This was the largest monthly increase among the countries analyzed. Prices were also 15.6% higher than three months ago, 2.7% above six-month levels, and 51.2% higher than a year earlier. The strong increases across all time horizons suggest tightening supplies and localized market disruptions affecting maize availability.

In **Zambia**, white maize prices declined sharply by 12.5% month-on-month to ZMW 5.54/kg, extending losses to 29.8% over three months and 20.2% over six months. Year-on-year, prices were 53.4% lower, representing the steepest annual decline among the countries monitored. The sustained downturn reflects significantly improved domestic supply prospects following an expected record maize harvest of nearly 5 million tonnes, which has increased market availability and eased supply concerns. At the same time, the appreciation of the local currency has helped lower import-related and transportation costs, further reducing market pressures.

<sup>35</sup> These price spreads are calculated based on online rates at: <https://www.oanda.com/currency-converter/en>

<sup>36</sup> **Mozambique Key Message Update, May – September 2026: Crisis (IPC Phase 3) outcomes expected due to floods, dry spells, and conflict – Mozambique | ReliefWeb**; <https://fews.net/southern-africa/mozambique/food-security-outlook/june-2026>

**Table 10: Percentage changes in maize prices in Southern Africa<sup>37</sup>**

| Country    | Crop          | Market                           | Last Price | 1 Month % | 3 Months % | 6 Months % | 1 Year % |
|------------|---------------|----------------------------------|------------|-----------|------------|------------|----------|
| Malawi     | Maize         | National Average, MWK/Kg         | 749.22     | -7.86 ↓   | -33.11 ↓   | -41.14 ↓   | -26.79 ↓ |
| Mozambique | Maize (white) | National Average, MZN/Kg         | 28.81      | 44.23 ×   | 15.59 ×    | 2.71 ▲     | 51.17 ×  |
| Zambia     | Maize (white) | National Average, Retail, ZMW/KG | 5.54       | -12.52 ↓  | -29.79 ↓   | -20.20 ↓   | -53.42 ↓ |

**Note:** Latest price is for June 2026, \* May 2026, and \*\* April 2026

 ▾ = low decrease (0–5%), ▾ = moderate decrease (5–15%), ▾ = high decrease (>15%)

## Rice

**Figure 11: National average price spreads for rice across select Southern African Countries**

**Figure 11** illustrates rice price movements (in USD per metric tonne) across Zambia, Mozambique, and Malawi, highlighting Zambia as the highest-priced market, followed by Malawi and Mozambique. Zambia's rice prices remained largely stable, declining marginally from US\$2,297/MT in May to US\$2,295/MT, indicating a well-balanced market with little month-on-month change. Malawi recorded a moderate 5% decrease in rice prices, falling from USD2,057/MT to approximately USD1,951/MT in June. However, the parallel exchange rate equivalent price of USD 888/MT is substantially lower than the official exchange rate price, suggesting a much lower effective market value. Mozambique registered the lowest rice prices among the three countries, with prices declining sharply by 16% from USD892/MT to USD752/MT. The pronounced reduction reflects improved

domestic supplies and seasonal market dynamics.

As illustrated in **Table 11**, rice prices in local currency terms across selected Southern African indicates a general downward trend across Southern African rice markets, with all three countries recording month-on-month price declines. The sustained decreases over three- and six-month periods suggest improved market availability and easing price pressures compared to earlier in the year. In **Malawi**, national average rice prices declined by 4.8% during the month to MWK 3,373.76/kg. The downward trend was also evident over the medium term, with prices falling by 17.8% over three months and 25.9% over six months. On an annual basis, rice prices were 8.2% lower than a year earlier, indicating relatively improved supply conditions and reduced inflationary pressure in the rice market.

**Mozambique** recorded the sharpest decline among the countries covered. Imported rice prices fell by 15.7% month-on-month to MZN 47.52/kg. Prices were also 19.5% lower than three months ago and 37.0% below levels recorded six months earlier. Compared to the same period last year, prices declined by 29.3%, pointing to significantly improved market supplies and weaker price pressures in the imported rice market. In **Zambia**, local rice prices remained relatively stable, declining by only 1.8% during the month to ZMW 41.41/kg. Prices remained lower by 3.0% than three months ago, while remaining virtually unchanged over six months (+0.2%). Year-on-year, rice prices fell by 5.7%, suggesting a generally stable market environment with limited price volatility compared to neighboring countries.

**Table 11: Percentage changes in rice prices in Southern Africa<sup>38</sup>**

| Country    | Crop            | Market                           | Last Price | 1 Month % | 3 Months % | 6 Months % | 1 Year % |
|------------|-----------------|----------------------------------|------------|-----------|------------|------------|----------|
| Malawi     | Rice            | National Average, MWK/Kg         | 3,373.76   | -4.83 ▾   | -17.79 ▾   | -25.90 ▾   | -8.21 ▾  |

<sup>37</sup> Author's construction based on AGRA MIS data for Malawi and Mozambique, and FAO data for Zambia and Zimbabwe

<sup>38</sup> Author's construction based on AGRA MIS data for Malawi and Mozambique, and FAO data for Zambia

## Beans

Figure 12: National average price spreads for beans across select Southern African Countries

Figure 12 illustrates national average bean price trends for Mozambique and Malawi, highlighting substantial price differences between Malawi and Mozambique. **Malawi** recorded the highest bean prices, increasing from USD2,447/MT to USD2,584/MT in June, representing a 6% month-on-month increase, suggesting a continued tight market supplies. However, when Malawi's June bean price is converted using the parallel exchange rate, the value falls sharply to approximately USD1,176/MT, making it cheaper than her neighbour Mozambique. Similarly, in **Mozambique**, bean prices also increased, rising from USD1,289/MT to USD1,409/MT in June, equivalent to a 9% increase, suggesting market supply tightness.

**Table 12** summarises bean price movements across Malawi, Mozambique and Zambia reflecting mixed market trends. In **Malawi**, common bean prices increased by 6.0% month-on-month, reaching MWK 4,468.79/kg. Despite this recent increase, prices remained 9.3% lower than three months ago, 33.8% below levels recorded six months earlier, and 17.1% lower than a year ago. These declines suggest improved market availability compared to previous periods, even though short-term price pressures have emerged. On the other note, Malawi's soybean market remained relatively stable during the month, recording a marginal increase of 0.4%. However, soybean prices declined sharply over the medium term, falling by 20.2% over three months and 40.6% over six months. In contrast to common beans, soybean prices were 10.4% higher than a year earlier, indicating that current prices remain elevated relative to historical levels despite recent market weakening.

In **Mozambique**, bean prices increased by 9.4% during the month, the strongest monthly increase among the countries covered. Prices reached MZN 89.06/kg, although they were still 4.7% lower than three months ago. Compared to six months earlier, prices were 3.0% higher, while annual prices were 5.8% above year-earlier levels. This pattern suggests tightening supplies in recent months. In **Zambia**, bean prices declined by 3.9% month-on-month to ZMW 41.84/kg, continuing a downward trend. Prices were 22.1% lower than three months ago, indicating improved market supplies and reduced-price pressure compared to earlier in the year.

Table 12: Percentage changes in beans prices in Southern Africa<sup>39</sup>

## Seasonal Monitor and Cropping Conditions<sup>40</sup>

In **Southern Africa**, harvesting for the 2025/26 main season is now complete with generally favorable end of season outcomes. End of season conditions are generally favourable despite unevenly distributed rainfall, including periods of flooding and dry spells in several areas. According to the European Commission Joint Research Centre, overall regional production is expected to be above average, driven by a maize harvest projected to be 10 percent above average in South Africa, a record harvest in Zambia, and a 2 percent increase in Zimbabwe's production compared to the previous year. Planting for the 2026/27 main season is expected to begin in September and given that past seasons with similar El Niño conditions have been associated with below-average maize yields, production prospects warrant close monitoring.

<sup>39</sup> Author's construction based on AGRA MIS data for Malawi and Mozambique, and Zambia Statistics Agency data for Zambia

<sup>40</sup> Crop Monitor No. 117 – July 2026: [https://www.croponitor.org/s/EarlyWarning\\_CropMonitor\\_202607-kdbf.pdf](https://www.croponitor.org/s/EarlyWarning_CropMonitor_202607-kdbf.pdf)

## West Africa Food Security Update

Figure 13: West African Countries Food Security Outlook, June 2026

**Burkina Faso** is expected to face significant food security challenges through January 2027, particularly in conflict-affected northern and eastern areas.<sup>41</sup> In Karo-Peli province, Crisis (IPC Phase 3) outcomes are projected from June to September 2026 as poor households struggle with inadequate incomes and high staple food prices, leading to reduced meal frequency and quantity and greater reliance on wild foods, although food assistance will help limit severe consumption gaps. From October 2026 to January 2027, Crisis conditions are expected to persist, but below-average harvests will help prevent major food shortages. In other insecure provinces, including Djelgodji, Dyamongou, Gobnangou, Komandjori, Kompienga, Loroum, Oudalan, Seno, and Yagha, Stressed (IPC Phase 2) outcomes are anticipated, with lower market prices, subsidized cereal sales, and food assistance supporting food access despite reduced consumption and weak livelihoods.

While slightly improved harvests are expected to meet basic food needs later in the year, household incomes will remain too low to support livelihood recovery. Overall, FEWS NET estimates that 1.5–1.99 million people, mainly poor host communities and internally displaced persons in high-insecurity areas, will require assistance, with needs peaking between July and August 2026.

**Mali's** food security situation remains highly concerning, particularly in conflict-affected northern regions. Emergency (IPC Phase 4) outcomes are ongoing in Kidal and Ménaka due to persistent insecurity that continues to disrupt livelihoods, markets, and food access, although conditions in Ménaka are expected to improve to Crisis (IPC Phase 3) from October as harvested crops and wild foods become available.<sup>42</sup> In contrast, Emergency conditions are likely to persist in Kidal through January 2027 because of severe economic disruption and market dysfunction. Nationally, between 2 and 2.49 million people are expected to require food assistance, with needs peaking between July and September, driven by the combined effects of insecurity, electricity and fuel shortages, high food prices, and low household incomes. While harvests, in-kind payments, and seasonal price declines are expected to improve food access from October onward, many households in conflict-affected areas will continue to face livelihood disruptions and rely on coping strategies, resulting in continued Stressed (IPC Phase 2) outcomes. Meanwhile, below-average rainfall forecasts, insecurity, limited access to agricultural inputs, population displacement, and reduced access to fields are expected to constrain agricultural production in parts of southern and western Mali, further increasing localized food security risks.

In **Niger**, Crisis (IPC Phase 3) food insecurity is expected to persist through January 2027 in the Tillabéry and Diffa regions and northwestern Tahoua, where insecurity, flooding, and restricted access to fields and markets continue to undermine livelihoods, reduce income opportunities, and force households to cut the number and size of daily meals.<sup>43</sup> A small group of very poor households and internally displaced persons are expected to face Emergency (IPC Phase 4) outcomes due to severe food consumption deficits. In areas less affected by conflict, Stressed (IPC Phase 2) conditions are expected from June to September 2026 as depleted food stocks, high market dependence, elevated food prices, and limited incomes constrain households' ability to meet non-food needs, with some flood-affected households likely deteriorating to Crisis. However, the arrival of new harvests between October 2026 and January 2027 is expected to improve food availability and consumption in these more stable areas, leading to Minimal (IPC Phase 1) outcomes. Food assistance needs are projected to peak at 2.5–2.9 million people during the August–September lean season, with internally displaced persons and poor households remaining the most vulnerable to food and income shocks.

**Nigeria's** food security situation continues to worsen, particularly in the northern regions, where persistent conflict, displacement, and insecurity are driving widespread Crisis (IPC Phase 3) and Emergency (IPC Phase 4) outcomes.<sup>44</sup> As the June–September lean season progresses, ongoing attacks by insurgent and bandit groups are disrupting agricultural activities, restricting access to farmland, displacing households, and constraining trade and livelihood

<sup>41</sup> <https://fewsn.net/west-africa/burkina-faso>

<sup>42</sup> <https://fewsn.net/west-africa/mali>

<sup>43</sup> <https://fewsn.net/west-africa/niger>

<sup>44</sup> <https://fewsn.net/west-africa/nigeria>

opportunities, with inaccessible areas of Borno State facing the most severe conditions. Food production remains below average due to poor dry-season harvests, reduced irrigation, and rising costs of fuel, fertilizer, and other agricultural inputs, limiting both current and main-season cultivation. As household food stocks decline, dependence on market purchases is increasing, but high inflation, currency depreciation, elevated transport costs, and persistently high food prices continue to erode purchasing power and reduce food access. Reflecting these pressures, Cadre Harmonisé projections indicated that approximately 34.8 million people across 27 states and the Federal Capital Territory (FCT) would face Crisis (Phase 3) or worse food insecurity between June and August 2026, up from about 27.2 million people in late 2025, with several areas of Borno expected to remain in Emergency (Phase 4) conditions.<sup>45</sup>

**Togo's** food security situation is deteriorating in parts of the north as the lean season progresses and household food stocks decline, particularly in the Savanes region where insecurity, population displacement, and the threat of extremist incursions continue to disrupt livelihoods, market access, and agricultural activities. The prefectures of Kpendjal and Kpendjal-Ouest remain the most affected, with instability restricting access to farmland and trade routes, forcing households to increasingly rely on coping strategies such as gathering wild plants and sand collection to meet food needs. Although markets in the Savanes region remain relatively supplied by carryover stocks, weak purchasing power, reduced population movement, and trade restrictions have constrained market activity, while rising fuel prices are expected to increase transport costs and inflationary pressures. Elsewhere in the country, food security conditions remain relatively stable, supported by food stocks from the previous season, income from market gardening, and generally favourable food prices. Agricultural activities are progressing normally across most areas, although below-average rainfall forecasts and irregular early-season rains in the north could negatively affect production prospects, prompting farmers to adopt drought-tolerant crop varieties to reduce the risk of crop losses.

## Commodity Prices

*Key drivers of the price movements in West Africa include.*

|                                                                                     |                                         |                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | <b>Insecurity &amp; Armed Conflicts</b> | Conflict, insecurity, and political tension in West Africa continue to disrupt agriculture, trade, and food assistance activities, resulting in higher food prices.                  |
|  | <b>Macroeconomic Challenges</b>         | Poor macroeconomic conditions, driven by high inflation rates, local currency depreciations and elevated fuel prices are pushing food prices upwards in some West African countries. |
|  | <b>Seasonal Dynamics</b>                | Seasonal changes in food supply, including the early onset of the lean season in most countries in West Africa, are putting upward pressure on food prices.                          |

## Maize

**Figure 14** illustrates maize price movements (USD/metric tonne) across selected West African markets between May and June, indicating generally declining maize prices across the region, with **Nigeria** being the only country to record an increase during the reporting period. **Mali** (Bamako) recorded the highest maize price among the monitored countries despite a slight decline from USD285/MT to US\$278/MT in June (a decrease of about 2 percent). **Burkina Faso** (Ouagadougou) followed closely, with prices easing from US\$276/MT to US\$270/MT, while remaining among the highest-priced maize markets in the region. In **Niger** (Niamey), maize prices fell modestly from US\$249/MT to USD243/MT, while **Ghana** recorded a similar decline from USD251/MT to USD241/MT, representing a decrease of approximately 4%.

**Togo** (Centrale) registered the largest decline among the countries analyzed, with prices falling by 8% from USD263/MT to USD242/MT, suggesting improved market supplies or reduced demand pressures. In contrast, **Nigeria** was the only country to experience an increase in maize prices, rising by 8% from USD237/MT to USD255/MT, elevating Nigeria's maize prices above those of Ghana, Togo, and Niger, indicating tightening domestic market conditions relative to neighboring countries.

<sup>45</sup> [Over 34 million Nigerians at risk of food crisis in 27 states by mid-2026 — Report - Tribune Online](#)

Figure 14: Price spreads for maize across select West African Countries<sup>46</sup>

**Table 13** presents maize price trends in local currencies across select West African countries with notable increases in parts of Burkina Faso, Mali, Niger, and Nigeria, while several markets in Ghana and Togo recorded declines. Despite these monthly fluctuations, annual comparisons indicate that maize prices remain substantially below levels recorded one year ago in most countries.

In **Burkina Faso**, maize prices were generally stable during the past month, with most markets recording no significant changes, although Dédougou registered a 6.0% increase, while Bobo Dioulasso recorded a moderate 3.3% increase over three months. Compared to the previous year, all monitored markets experienced substantial declines ranging from 29% to 38%, reflecting improved domestic supplies and easing market pressures.

**Ghana** recorded a significant decline in maize prices, with the national average falling by 7.8% month-on-month, 11.3% over three months, and 27.7% over six months. Similarly, year-on-year, prices were 57% lower, representing the largest annual decline among the countries analyzed and indicating a marked improvement in maize availability.

In **Mali**, maize market trends were mixed, with prices increases recorded in Gao (+8.7%), while Ségou recorded a sharp 14.3% monthly decline. Other markets remained largely stable. Medium-term trends show rising prices in Sikasso (+7.7% over three months and +12.0% over six months), whereas prices declined in Gao, Kayes, and Tombouctou over six months. Annual prices were significantly lower across all markets, with declines ranging from 19% to 36%. In **Niger**, imported maize prices also exhibited mixed movements. Prices increased in Maradi (+6.9%), supported by a 10.7% rise over three months, while Dosso recorded a 6.7% decline during the month. Prices in Agadez, Niamey, and Zinder remained largely stable. Despite localized increases, all markets continued to report lower prices than a year ago, with annual declines ranging from 35% to 44%.

**Nigeria** recorded one of the strongest upward trends among the monitored countries, with the national average maize price increasing by 8.3% over the past month, 14.7% over three months, and 3.7% over six months. The recent upward movement reflects a combination of tightening market supplies, elevated fuel prices, and higher transportation costs, which have increased the cost of moving grain from surplus-producing areas to major consumption centers. Seasonal stock drawdowns ahead of the main harvest, coupled with persistent security challenges in some key production zones that continue to disrupt production and market flows, have also contributed to stronger price pressures. Despite these recent increases, maize prices remained 36.2% below year-earlier levels, suggesting that current prices are recovering from relatively low levels recorded in the same period last year, when improved market availability and higher carryover stocks helped moderate prices.

In **Togo**, maize prices declined across most markets. Monthly reductions ranged from 0.6% in Maritime to 6.1% in Centrale, while three-month declines reached 16.5% in the Lomé (DAGL) region. Annual price decreases were also substantial, varying between 28% and 42%, suggesting adequate supplies and relatively weak price pressures.

<sup>46</sup> These price spreads are calculated based on online rates at <https://www.oanda.com/currency-converter/en>

## Rice

**Figure 15: Price spreads for rice across select West African Countries<sup>48</sup>**

**Figure 15** illustrates rice price movements (USD/metric tonne) across selected West African markets, showing generally stable prices with modest month-on-month movements between May and June. **Ghana** recorded the highest rice price among the countries analyzed, with prices increasing from USD938/MT to USD980/MT, representing a 4% increase, suggesting a continued upward pressure on the rice market, possibly driven by strong demand or import-related costs. **Mali** and **Togo** experienced price declines during the month, with rice prices in the former falling slightly from USD800/MT to USD783/MT (-2%), while the latter registered the largest decline among the monitored countries, dropping from USD788/MT to USD732/MT, a 7% decrease pointing to improved market supplies and reduced demand pressures. In **Niger** (Niamey), rice prices decreased marginally from USD782/MT to USD765/MT (-2.2%), while **Burkina Faso** (Ouagadougou) recorded a similar reduction from USD658/MT to USD644/MT (-2%), indicating relatively stable market conditions. **Nigeria** remained the lowest-priced rice market in the group despite recording 4% increase from USD463/MT to USD481/MT. Although prices increased, Nigeria's rice remained substantially cheaper than in neighboring markets, reflecting comparatively stronger domestic availability.

marginally from USD782/MT to USD765/MT (-2.2%), while **Burkina Faso** (Ouagadougou) recorded a similar reduction from USD658/MT to USD644/MT (-2%), indicating relatively stable market conditions. **Nigeria** remained the lowest-priced rice market in the group despite recording 4% increase from USD463/MT to USD481/MT. Although prices increased, Nigeria's rice remained substantially cheaper than in neighboring markets, reflecting comparatively stronger domestic availability.

**Table 14** shows that rice prices, expressed in local currencies, exhibit generally stable to declining rice prices across West Africa, although notable increases were observed in selected markets in Mali, Ghana, Nigeria, and Togo. Compared to a year earlier, most markets recorded lower prices, reflecting improved supply conditions and relative market stability.

<sup>47</sup> Author's construction based on 1) AGRA MIS for Ghana & Nigeria; and 2) FAO data for Togo

<sup>48</sup> These price spreads are calculated based on online rates on the last day of the month at <https://www.oanda.com/currency-converter/en>

In **Burkina Faso**, imported rice prices remained largely stable during the past month. Prices were unchanged in Bobo Dioulasso, Fada N'Gourma, and Ouagadougou, while Dori recorded a moderate increase of 4.8%. On an annual basis, prices were significantly below year-earlier levels, declining by between 10% and 24%, suggesting adequate market supplies. **Ghana** recorded a slight monthly increase of 0.5% in the national average rice price. Despite modest gains over the past three months (4.3%), prices remained 29.6% lower than a year ago, indicating that current market prices are considerably below the elevated levels seen in 2025.

In **Mali**, domestic rice markets exhibited mixed trends. The most significant increase was observed in Gao, where prices rose by 20% month-on-month, 33.3% over three months, and 20% over six months, driven by conflict-related market disruptions, restricted trade flows, and inflated fuel and transport costs. Meanwhile, rice prices in Bamako, Kayes, and Sikasso remained largely unchanged. For imported rice, prices were generally stable to declining, with year-on-year decreases ranging from 16 to 24 percent across most markets. The rice price stabilization across majority markets in Mali can be partially attributed to the Government's intervention when it announced in April 23, 2026, that it will purchase 26,030 tonnes of unsold, locally produced rice to stabilize the national market and support domestic farmers<sup>49</sup>.

In **Niger**, imported rice prices were remarkably stable, with monthly prices remaining unchanged in all the markets except Maradi that recorded a modest decline of 2.3%. Annual comparisons show prices were between 6% and 13% lower than one year earlier, reflecting relatively comfortable supply conditions. **Nigeria** experienced a moderate monthly increase in milled rice prices of 4.5%. However, prices remained 14.9% lower than three months ago and 39.5% below year-earlier levels, suggesting that despite recent gains, domestic rice prices have softened considerably compared to 2025. In **Togo**, imported rice markets recorded mixed movements. Prices increased in the Lomé (DAGL) region (+1.6%), while declining in Centrale (-5.0%), Maritime (-2.0%), and Savanes (-1.6%). Over six months, Maritime and Lomé registered increases of 9.6% and 5.1%, respectively, whereas Savanes experienced a decline of 3.3%. Year-on-year trends were similarly mixed, with prices remaining below last year's levels in Savanes and Centrale, while Maritime registered a modest annual increase of 6.8 percent. Looking ahead, the fuel price increase implemented at the end of May is expected to exert additional upward pressure on transportation and distribution costs, potentially contributing to broader inflationary pressures.

## Millet

**Figure 16: Price spreads for millet across select West African Countries<sup>51</sup>**

**Figure 16** illustrates millet price movements (in USD per metric tonne) across selected West African markets, showing a general decline in prices between May and June, with the exception of Nigeria, where prices increased during the reporting period. **Niger** (Niamey) recorded the highest millet price in June at USD400/MT, although prices declined marginally by 2% from USD409/MT in May.

Similarly, **Burkina Faso** (Ouagadougou) registered a slight 4% price reduction from USD400/MT to USD383/MT, with the most significant price decrease observed in **Mali** (Bamako), where millet prices fell sharply by 22% from USD400/MT to USD313/MT. These substantial price reductions suggest improved market supplies, driven by increased availability from domestic production or strengthened cross-border trade flows. In contrast,

**Nigeria** was the only country to record an increase in millet prices, rising from USD300/MT to USD328/MT, an increase of about 9 percent, indicating tighter supplies compared to neighboring markets.

**Table 15** shows that millet prices, expressed in local currencies, exhibit mixed short-term trends across West African markets, with notable increases in several markets in Niger and Nigeria, while most markets in Burkina Faso and Mali recorded stable or declining prices. Overall, annual comparisons indicate that millet prices remain substantially below their levels of one year ago in most monitored markets.

In **Burkina Faso**, millet prices were generally stable to lower during the past month. Significant declines were recorded in Dédougou (-6.7%), Kongoussi (-6.3%), and Ouagadougou (-2.2%), while modest increases were observed in Fada N'Gourma (+3.7%) and Dori (+1.8%). Over a one-year period, all markets posted considerable declines ranging from 4% in Bobo Dioulasso to 47% in Tenkodogo, reflecting improved availability and weaker price pressures.

In **Mali**, monthly market performance was generally stable or declining, with few exceptions. Bamako recorded the largest decline, with prices falling by 20% compared to the previous month. Prices also decreased in Ségou (-6.7%) and Mopti (-2.2%), while Gao (+5.8%) and Tombouctou (+3.7%) experienced moderate increases. Despite these localized gains, all monitored Malian markets recorded year-on-year declines of between 13% and 45%, indicating substantially improved market conditions compared to last year.

**Niger** exhibited the strongest upward price movements in the region. Monthly millet prices surged in Maradi (+22.9%), while smaller increases were recorded in Tillabéri (+4.2%) and Zinder (+4.4%). Medium-term trends were also strongly positive, with prices in Maradi rising by 30.3% over both three and six months, while Zinder and Tillabéri registered gains exceeding 8% during the same period. Despite these recent increases, annual prices remained below year-earlier levels across all markets, declining between 12% and 38%.

In **Nigeria**, the national average millet price increased by 10.1% over the past month and was 23.7% higher than six months ago, pointing to tightening domestic market conditions. However, prices remained 22.2% lower than a year earlier, indicating that recent increases have only partially reversed previous declines.

Overall, millet markets across selected West African countries remain better supplied than they were a year ago, as reflected by the widespread annual price declines.

<sup>51</sup> These price spreads are calculated based on online rates at <https://www.oanda.com/currency-converter/en>

## Sorghum

**Figure 17: Price spreads for sorghum across select West African Countries<sup>53</sup>**

**Figure 17** presents sorghum prices (in USD per metric tonne) across selected West African markets, showing relatively stable prices between May and June, with only modest month-on-month fluctuations across most countries.

**Ghana** remained the highest-priced sorghum market in the region, with prices increasing by 4%, from USD503/MT to USD523/MT in June, suggesting continued strong demand and tighter domestic supplies compared to neighboring countries. Among the Sahelian countries, price movements were generally limited. For instance, **Burkina Faso** (Ouagadougou) recorded a slight decline from USD311/MT to USD304/MT, while **Mali** (Bamako) saw prices fall from USD285/MT to USD278/MT, with these declines indicating improvement

in market stability and reduced-price pressures. In **Nigeria**, sorghum prices also edged downward, declining from USD290/MT to USD282/MT, reflecting a relatively stable market environment. Conversely, **Niger** (Niamey) registered a small increase from US\$285/MT to US\$296/MT, making it the only country besides Ghana to record higher sorghum prices during the month.

**Table 16** illustrates sorghum prices across selected West African markets, showing mixed short-term price movements but a predominantly downward trend over the past year. Most markets recorded either stable or declining prices on a monthly basis, while year-on-year comparisons show sorghum prices remain below levels recorded twelve months earlier. In **Burkina Faso**, monthly price movements were generally subdued, with prices unchanged in

<sup>52</sup> Author's construction based on 1) AGRA MIS for Ghana & Nigeria; and 2) FAO data for Burkina Faso, Mali, Niger, and Togo

<sup>53</sup> These price spreads are calculated based on online rates at <https://www.oanda.com/currency-converter/en>

most markets. However, Dédougou recorded an 8.6% decline over the past month, while Tenkodogo registered a modest 2.9% increase. Compared to a year earlier, all monitored markets reported substantial declines ranging from 2% in Bobo Dioulasso to about 37% in Tenkodogo, reflecting improved supplies and reduced market pressure. In **Ghana**, the national average sorghum price declined by 1.2% month-on-month, 2.8% over three months, and nearly 8% over six months. Similarly on an annual basis, prices were approximately 9% lower than a year ago, indicating relatively stable and strong market conditions. For **Mali**, market trends were mixed, with price increase recorded in Gao (+5.77%) and remained stable in Bamako and several other markets, while Ségou recorded a 6.7 percent monthly decline. Over the longer term, most Malian markets experienced year-on-year declines ranging between 11% and 36%, suggesting improved availability of sorghum across the country.

In **Niger**, upward price pressure was more evident than elsewhere in the region, with monthly increases recorded in Maradi (+14.3%), Tillabéri (+10.8%), Niamey (+6.3%), Zinder (+5.0%), and Dosso (+2.8%). Three-month increases were particularly strong in Maradi (+23.1%), Zinder (+16.7%), and Tillabéri (+13.9%), indicating tightening local supplies as a result of stronger local demand. Despite these recent increases, year-on-year prices remained significantly lower, declining by 13–38 percent across monitored markets. In **Nigeria**, the national average price of white sorghum fell by 2.2 percent during the month but remained 20.5 percent higher than three months ago and 39.2 percent above levels recorded six months earlier. Nevertheless, prices were still 14 percent lower than a year ago, suggesting that recent domestic market tightening has not fully reversed the broader downward annual trend.

## Seasonal Monitor and Cropping Conditions<sup>55</sup>

In **West Africa**, planting and early development of main-season cereals are progressing under generally favourable rainfall conditions. However, delayed rainfall onset in parts of the Sahel, particularly central-eastern Nigeria and southeastern Chad, may affect planting and crop establishment. Meanwhile, persistent insecurity in Mali, Burkina Faso, Niger, Chad, and northeastern Nigeria continues to disrupt agricultural activities, constrain production, and undermine livelihoods.

<sup>55</sup> Crop Monitor No. 116 – June 2026: [https://www.croplmonitor.org/s/EarlyWarning\\_CropMonitor\\_202606-x95c.pdf](https://www.croplmonitor.org/s/EarlyWarning_CropMonitor_202606-x95c.pdf)

## Food Trade Updates

### East and Southern Africa Region Food Trade Updates

**Figure 18** provides an overview of the trade-related interventions and investments in June 2026 across various countries in East and Southern Africa over the past month and that are affecting the food trade in the region.

*Figure 18: East and Southern Africa cross-border trade updates, June 2026*

#### **Ethiopia and Kenya**

Ethiopia and Kenya have introduced a formal cross-border trade framework that allows licensed residents living near official border crossings to legally trade approved goods worth up to US\$1,000 per month through regulated channels. Designed to support local livelihoods, strengthen supply chains, and curb informal trade and smuggling, the scheme covers designated border zones, prioritizes women and vulnerable groups, and permits trade in selected livestock, agricultural products, and consumer goods. All transactions must pass through official customs posts, with traders required to declare goods and comply with applicable taxes and regulations, providing a structured and monitored alternative to long-standing informal cross-border commerce.

**Figure 19** provides an overview of the trade-related interventions and investments in June 2026 across various countries in West Africa over the past month and that are affecting the food trade in the region.

*Figure 19: West Africa cross-border trade updates, June 2026*

#### **Côte d'Ivoire, Ghana, Togo, Benin, and Nigeria**

Côte d'Ivoire, Ghana, Togo, Benin, and Nigeria have officially launched the Abidjan–Lagos Corridor Management Authority (ALCoMA) to oversee the development and long-term management of the 1,028-kilometre Abidjan–Lagos Multimodal Corridor. Expected to be operational by 2030, the project will feature a six-lane coastal highway and a parallel high-speed railway linking five of West Africa's largest economies, improving the movement of people, goods, and services along a key trade route. The corridor is projected to generate more than US\$16 billion in annual trade and about US\$1.3 billion in toll revenues, while boosting regional integration, industrialization, job creation, and intra-African trade under the AfCFTA, ultimately benefiting over 500 million people across the region.
